INTRODUCTION

Insite Group, Inc. (IGI), on behalf of Mr. Joseph Buffone of JBRL Development Corp., provides this RAPR summarizing activities and findings for the referenced period at the Valley Village facility in Cowanshannock Township, Armstrong County, Pennsylvania (property). This RAPR includes a summary of site activities completed during the period, data interpretation, proposed future actions, a historical summary, and a description of site geology. A topographic map is provided as **Figure 1**, and a site map is provided as **Figure 2**.

A release of unleaded gasoline was discovered and reported in March 2014 during an upgrade of the UST system. Extensive impacts to soil and groundwater were identified during site characterization. Excavation of impacted soil was completed in 2016, and attainment of the SHS-RUA was demonstrated for soil at that time.

Remedial Action Plan Addendum No. 2 was submitted to the PADEP on August 14, 2017 and was approved on August 24, 2017. The report provided a plan to address adsorbed-phase contaminant mass in the UST cavity and dissolved-phase contaminant mass in downgradient areas, including the sanitary sewer line trench. The proposed treatment included the following:

- Ivey-sol surfactant washing of the UST cavity.
- Ivey-sol surfactant washing of the sewer line trench backfill in the area surrounding SL-3 and SL-4.
- Carbon Based Injectate (CBI) treatment to address the remaining dissolved-phase plume downgradient of the UST cavity. The final CBI treatment design will be completed following the conclusion of surfactant treatment and a period of monitoring and data evaluation.

The first cycle of surfactant washing of the UST cavity was completed in September through November 2017. In accordance with the RAP Addendum No. 2, IGI evaluated the data following the first surfactant treatment cycle. A summary of the results was provided in the 2017 4th quarter RAPR.

In the 4th quarter 2017, USTIF requested that no additional surfactant washing be completed until USTIF completes a separate review of the data. USTIF's review is ongoing.

CONTAMINANTS OF CONCERN

The contaminant of concern at the site is unleaded gasoline, and the chemicals of concern are defined by PADEP's Post-2008 short list of parameters for unleaded gasoline (benzene, ethylbenzene, cumene, MTBE, naphthalene, toluene, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, and total xylenes).

<u>Media</u>	<u>Cleanup Standard</u>	<u>Parameters Exceeding the Cleanup Standard</u>
Soil	SHS-RUA	Attainment of the SHS-RUA is demonstrated for soil.
Groundwater	SHS-RUA	Benzene, ethylbenzene, MTBE, naphthalene, 1,2,4-trimethylbenzene.

The site is defined by the extent of the monitoring well network. POC wells are shown in bold font and include **MW-3R**, **MW-4R**, **MW-8**, **MW-13** and **MW-14**.

REGULATORY STATUS

Attainment of the SHS-RUA has been demonstrated for soil. Remediation to address the remaining dissolved-phase plume (including the adsorbed-phase contaminant mass below the water table in the UST cavity) is underway.

SITE ACTIVITIES COMPLETED DURING PERIOD

Quarterly Groundwater Monitoring

Quarterly groundwater sampling was completed on May 8 and 9, 2018. Depth-to-water measurements were recorded for all accessible monitoring wells, extraction wells, piezometers, and sewer line trench wells. Depth-to-water measurements and calculated groundwater elevations are summarized in **Table 1.0**. Groundwater elevation data were used to prepare a groundwater contour map, provided as **Figure 3**.

Groundwater samples were collected from ten monitoring wells (MW-1R, **MW-3R**, **MW-4R**, **MW-8**, MW-9, MW-10, MW-11, **MW-13**, **MW-14**, and MW-15), two extraction wells (EW-1R and EW-2), and two sewer line trench wells (SL-3 and SL-4). Wells were sampled using a low flow purging and sampling approach. The samples were submitted for laboratory analysis of unleaded gasoline parameters by method 5030B/8260B. For quality assurance purposes, a duplicate sample and a trip blank were also submitted for laboratory analysis.

The groundwater analytical results are summarized in **Table 2.0**. A summary of contaminant concentrations exceeding their respective SHS-RUA values is provided below:

Well	Benzene	1,2,4-Trimethylbenzene	Ethylbenzene	Naphthalene	MTBE
EW-1R	249	1,490	1,520	116	
MW-3R	394	857	1,080		
MW-8	2,550				42.8
SL-3	46.8				
MW-15	23.9				
MW-13					66.7

Concentrations of unleaded gasoline parameters do not exceed their respective SHS-RUA values in monitoring wells MW-1R, **MW-4R**, MW-9, MW-10, MW-11, or **MW-14**. Monitoring wells MW-2, MW-5, MW-6, MW-7, and MW-12, previously exhibited eight or more consecutive

IGI Contacts: Sara Giordano and Paul Rogers

quarters of results below SHS-RUA values and sampling was discontinued for these wells after Fourth Quarter 2016.

Historical groundwater analytical results are summarized in **Table 3.0**. Laboratory analytical reports are provided as **Attachment A**. Dissolved-phase contaminant isoconcentration maps are provided as **Figures 4 through 8**.

Field measurements of DO, ORP, and pH were recorded for each well sampled. The data are summarized in **Table 4.0**.

Current UST System

In May 2018, IGI was made aware of repeated incidences of water in the premium unleaded gasoline UST (Tank 003). The current owner of the facility, Surya Shakti, Inc., contracted Reitz & Sons to remove water from Tank 003 on three separate occasions in 2017 and 2018.

Approximately 400 gallons of water was removed from the tank in May 2017. In February 2018, an additional 100 gallons of water was removed from the tank, and a new cap was installed. In March 2018 an additional 50 gallons of water was removed from the tank, and a broken drop tube was replaced.

In May 2018, the PADEP issued a Notice of Violation to Surya Shakti, Inc. due to the poor condition of the concrete around the tank top manholes. Because the concrete has deteriorated, the metal lid is resting directly on the fill cap, which now bears the weight of traffic passing over the lid.

Data Evaluation

Contaminant concentration trend graphs for source area and distal wells are provided as **Figures 9 and 10**, respectively. Overall, contaminant concentrations have decreased throughout much of the site. The most notable reductions have occurred in wells within or near the 2016 area of excavation (EW-2, MW-1R, **MW-4R**) and in downgradient well MW-10. Overall, the data continue to suggest that surfactant washing of the UST cavity reduced the adsorbed-phase contaminant mass in the UST cavity and had a beneficial effect on the groundwater plume.

During surfactant washing of the UST cavity, the benzene concentration in **MW-8** decreased to <1.0 ug/L. Since the conclusion of surfactant washing, the benzene concentration in **MW-8** has returned to pre-treatment levels. Contaminant concentrations in EW-1R (located on the downgradient edge of the UST cavity) and **MW-3R** (located approximately 20 feet downgradient of the UST cavity) also remain elevated, suggesting that dissolved-phase contamination continues to emanate from the UST cavity.

A map showing the reductions in the size and magnitude of the dissolved-phase plume over time is provided as **Figure 11**. The map shows the dissolved-phase plume before excavation (which occurred in September-October 2016), after excavation / before surfactant washing, and after surfactant washing.

PADEP Contact: Julia Gorman

USTIF ID No. 2014-0036(S)

IGI Contacts: Sara Giordano and Paul Rogers

CONCLUSIONS

Soil contamination was successfully remediated through excavation, and the extent and magnitude of the dissolved phase groundwater plume has been reduced through excavation and treatment of the UST cavity. A dissolved-phase groundwater plume persists downgradient of the UST cavity.

PROPOSED FUTURE ACTIONS

The proposed future action will be developed after the receipt of USTIF's third-party reviewer's evaluation and comments. Previously, the third-party reviewer shared their interest in applying carbon-based injectate (CBI) technology at the site, and IGI provided information for the application of this technology. The design of the CBI application should be reconsidered based on the current data.

RELEASES

March 19, 2014 Unleaded Gasoline A release of unleaded gasoline was discovered during an upgrade of the tank tops. Strong odors were noted in the area of the sump on Tank 003, and SPL was observed on the pit water.

POTENTIAL RECEPTORS

Surface Water: Cowanshannock Creek is located approximately 250 feet south of the UST cavity and is the nearest surface water feature. Groundwater at the site flows south toward the creek. Dissolved-phase contaminants are currently not detected in the most downgradient monitoring wells. Therefore, no adverse impacts to Cowanshannock Creek are expected.

Water Well Survey: A search of the PaGWIS database identified three water wells within 0.25 miles of the site. All three wells are located northwest and upgradient/crossgradient of the site. The nearest well is approximately 700 feet from the site. None of these wells is likely to be impacted by the release at the site.

Municipal Water Supply: The facility is serviced by public water supplied by the Cowanshannock Township Municipal Authority. Valley Village is the last customer on the water line. Properties to the east receive public water from the Rural Valley Municipal Authority. Cowanshannock Township Municipal Authority obtains its water from a number of wells located greater than 1.5 miles north of SR 85. The wells are greater than 150 feet in depth. Rural Valley Municipal Authority

obtains its water from several wells and springs. Most of these are located greater than one mile from Valley Village. One well is located 200 yards south of State Route 85 and approximately 0.5 miles east of Valley Village. The wells are greater than 150 feet in depth. All of these wells are located upgradient or crossgradient of the property and are not likely to be impacted by the release at the site.

SITE HISTORY

- 1985: The subject property was developed as a gasoline retail station and convenience store. The existing gasoline USTs (Tanks 001 through 003) and a diesel fuel UST (Tank 004, later removed) were installed at that time. Previously, the property was undeveloped.
- March 2014: A release of unleaded gasoline was discovered and reported during an upgrade of the tank tops. Strong odors were noted in the area of the sump on Tank 003, and SPL was observed on the pit water. Two soil samples and one groundwater sample were collected and submitted for laboratory analysis of unleaded gasoline parameters. Concentrations of unleaded gasoline parameters exceeded their respective SHS-RUA values in both soil and groundwater.
- June 2014: IGI completed five soil borings (B-1, B-2, B-3, B-4 and B-5), installed one nested vapor monitoring point (VM-1, 2 - 3 feet bgs and 4 - 5 feet bgs screened intervals) and installed five monitoring wells (MW-1, MW-2, **MW-3**, **MW-4** and MW-5) on the Valley Village property. Concentrations of unleaded gasoline parameters exceeded their respective SHS-RUA values in both soil and groundwater.
- August 2014: IGI completed five additional soil borings (B-6, B-7, B-8, B-9 and B-10) and installed six additional monitoring wells (MW-6, MW-7, **MW-8**, MW-9, MW-10 and MW-11) and one pilot test well (PT-1). Some of the soil borings and monitoring wells were installed on the downgradient CCWA property in accordance with a signed property access agreement. The extent of impact to soil and groundwater was not defined.
- September 2014: Slug tests were completed in monitoring wells MW-1, **MW-8** and MW-10. Permeability was calculated to be 0.4 feet/day (MW-1), 0.004 feet/day (**MW-8**), and 0.005 feet/day (MW-10).
- September 2014 – January 2015: Installed VM-2 and VM-3. Soil vapor sampling was completed. Contaminant concentrations did not exceed their respective Nonresidential MSC_{SG} values in any of the soil vapor monitoring points. The benzene concentration exceeded the Residential MSC_{SG} value in VM-3 (installed in the source area) during the first of two sampling events for this soil vapor point.
- November 2014: IGI requested a property access agreement with Consol Energy, owner of the next property downgradient from the CCWA property. Consol Energy denied the request in an email dated November 11, 2014. Therefore, no additional monitoring wells

IGI Contacts: Sara Giordano and Paul Rogers

could be installed downgradient of MW-10, and the extent of impact to groundwater could not be fully delineated in the downgradient direction.

- November – December 2014: IGI completed an in situ chemical oxidation pilot study using PersulfOx. A test pit was excavated into the groundwater table in an area of highly impacted soil and groundwater, and approximately 115 pounds of PersulfOx was mixed with the soil in the saturated zone. Soil and groundwater samples were collected at specified times before and after the oxidant application to evaluate the effectiveness of the product. The pilot study showed that PersulfOx was able to oxidize gasoline contaminants in both soil and groundwater, but that there was little effect on contaminant concentrations downgradient of the test pit due to the large amount of adsorbed phase contaminant mass at the site.
- December 2014: IGI completed two soil borings (B-11 and B-12) and installed one monitoring well (MW-12), one extraction well (EW-1), and four UST cavity injection wells (CP-1 through CP-4). Concentrations of unleaded gasoline parameters did not exceed their respective SHS-RUA values in soil or groundwater. The extent of impact to soil was fully delineated during this investigation. The extent of impact to groundwater was delineated to the extent possible.
- December 2014: Approximately 338 gallons of groundwater and product globules was removed from the UST cavity using vacuum extraction.
- March 2015: An SCR/RAP was submitted to the PADEP. The SHS-RUA was selected as the cleanup standard, and the proposed remediation included a combination of excavation and oxidant application.
- June 2015: The PADEP approved the SCR/RAP with modifications.
- October 2015: Monitoring wells **MW-13, MW-14**, and MW-15, extraction well EW-2, piezometers P-1 and P-2, and vapor monitoring point VM-4 were drilled and installed.
- August 2016: Approximately 160 pounds of RegenOx Part A was mixed in slurry form and injected into the UST cavity.
- September – October 2016:
 - A total of 1,919.71 tons of impacted soil was excavated and disposed at Greentree Landfill in Kersey, PA. Attainment of the SHS-RUA was demonstrated for soil.
 - A total of 10,781 gallons of groundwater was extracted during excavation and disposed at Danco Industries in Harrisville, PA.
 - A PlumeStop barrier was installed along the downgradient property boundary. A total of 4,000 pounds of PlumeStop and 495 pounds of ORC was applied to a trench approximately 70 feet long, 5 feet wide, and 17 feet deep.
 - An additional 160 pounds of RegenOx Part A was mixed in slurry form and injected into the UST cavity.

- Wells MW-1R, **MW-3R**, **MW-4R**, P-2R, EW-1R were installed to replace wells removed during excavation.
- August 2017: RAP Addendum No. 2 was submitted to and approved by the PADEP.
- September – November 2017: The first cycle of Ivey-sol surfactant washing of the UST cavity was completed. A total of 120 gallons of Ivey-sol concentrate (diluted at a 1:25 ratio) was injected into the UST cavity to desorb adsorbed-phase contamination. The injected fluids and desorbed contaminants were subsequently extracted and transported to Danco Industries, Inc. in Barkeyville, PA for recycling.

GEOLOGY

Regional Geology

The site is located in the Intermontane Pittsburgh Low Plateau Section of the Allegheny Plateau Physiographic Province. The Appalachian Plateau Province extends in a northeast direction from northern Alabama to New York. In Pennsylvania it occupies more than 26,000 square miles, nearly 60 percent of the total area of the state. This province is characterized by folded bedrock where the ridges are supported by anticlines and the valleys are underlain by synclines. The province in Pennsylvania is divided into seven sections, based on the elevations along the ridges and the depth of erosion. The bedrock in the Pittsburgh Low Plateau is gently folded with dips seldom exceeding five degrees. The rock types are mostly shale with sandstone, siltstone and limestone occurring locally.¹

The site is underlain by rocks of Pennsylvanian age. Stratigraphically, the highest geologic formation is the Casselman Formation, which outcrops on ridge tops east of the site. The extent and thickness of this formation is limited. The formation below the Casselman is the Glenshaw Formation. This unit consists primarily of marine shale and limestones, with locally mined coal deposits. Documented strip mining activity took place in the area between 1990 and 2005. The Allegheny Formation underlies the site, State Route 85 west of Yatesborough, PA and portions of Cowanshannock Creek. The Allegheny Formation includes repeating cycles of coal, limestone and sediments ranging from claystone to coarse sandstone. This unit was defined to include all the economically significant coal seam in the area. The Upper Freeport is defined as the upper boundary of the Allegheny and has been extensively deep mined south and east of the site. The mining took place between 1896 and 1931 in the Yatesborough Number 2 and Number 3 mines.²

Structurally the site sits between the axes of two anticlines and is near the axis of a syncline.³ The anticipated dip of the rock is expected to be near zero.

The soils at the site are classified as the Ernest series of soils which are derived from colluvial material that moved down slope from nearby uplands. Soil Conservation Service maps indicate the presence of these soils north and south of Route 85 and Cowanshannock Creek and along creeks and valley walls in the area.⁴

Site Geology and Hydrogeology

The subsurface at the site consists primarily of silty clay with weathered sandstone and shale fragments and traces of sand, gravel and scoria (burned shale and sandstone). The thickness of the silty clay layer ranges from 9 to 24 feet thick. Overall the material tends to be stiff to hard with some thin, soft zones. The poorly sorted texture and varied composition are characteristic of a colluvial soil.

In some areas, the colluvial silty clay is overlain with several feet of fill consisting of sand, gravel, weathered shale, silty clay, and cinders in varying combinations. Residual soils were only identified in four borings and consisted of gray plastic silty clay encountered at a depth of approximately 18 feet bgs and weathered shale and sandstone occurring between 19 and 27 feet bgs.

Groundwater is present in thin, discontinuous zones throughout the site. These thin, groundwater-bearing zones are most abundant between 2 to 6 feet bgs but were also identified as deep as 17 feet bgs. Some of the thin, groundwater-bearing zones were identified in shallow fill material. Other thin, groundwater-bearing zones were identified within soft zones in the otherwise stiff to hard colluvium. Because the groundwater-bearing zones are very thin, the total volume of groundwater present at the site is relatively low.

Fill material in the UST cavity consists of pea gravel and shale fill. The static groundwater level in the UST cavity ranges from approximately 2 to 3 feet bgs. The UST cavity acts as a groundwater reservoir that slowly surcharges the thin, groundwater-bearing zones at the site. During dry periods when the groundwater level in the UST cavity is lower, groundwater flow through the shallowest groundwater-bearing zones may be limited.

During dry periods, groundwater recovery at the site is very slow following groundwater extraction (days to weeks). During wetter periods, groundwater may recover more quickly. Slug test results indicated that the permeability ranged from 0.4 feet per day in MW-1, located in close proximity to the UST cavity, to 0.004 feet per day in MW-8, located farther downgradient. Based on the results of various pilot tests, it appears that the shallow groundwater-bearing zones are more permeable than the deeper zones. Piezometers screened exclusively in the deeper zone did not exhibit influence during a vacuum extraction pilot test while wells screened exclusively in the shallow zone and wells screened throughout the groundwater-bearing zones did exhibit influence. During a pilot study in which PersulfOx was injected into a shallow trench, the injected product was identified in a monitoring well located 63 feet downgradient within 10 days. During the excavation of the PersulfOx pilot study trench, a thin, water-bearing zone was

encountered within a layer of sandstone cobbles at 3 feet bgs.

Generally, groundwater flows southward toward Cowanshannock Creek, which is the likely groundwater receptor and topographically the lowest point south of the UST cavity.

PERMITS / ACCESS AGREEMENTS

- Property Access Agreement with CCWA for completion of soil borings and installation of monitoring wells on the adjacent CCWA property.
- Property Access Agreement with CCWA for excavation of impacted soil on the adjacent CCWA property.

IGI requested a property access agreement with Consol Energy, owner of the next property downgradient from the CCWA property. Consol Energy denied the request in an email dated November 11, 2014.

MONITORING

Well Specifications:	Fifteen, 2-inch diameter monitoring wells (MW-1R through MW-15). One, 8-inch diameter extraction well (EW-1R). One, 4-inch diameter extraction well (EW-2). One nested set of 1-inch diameter soil vapor monitoring points (VM-1). Three single 1-inch diameter soil vapor monitoring points (VM-2R, VM-3R, and VM-4). One, 2-inch piezometer (P-2R).
Gauging Frequency:	Quarterly at all monitoring wells.
Sampling Frequency:	Quarterly at select monitoring wells.
Analytical Laboratories Used:	ESC Lab Sciences, Mt. Juliet, TN. Pace Analytical Services, Inc., Greensburg, PA.
Analytical Method Used:	EPA Method 5030B/8260B for unleaded gasoline parameters in groundwater.

RE: Project: Valley Village - QTR
Pace Project No.: 30252655

Dear Ms. Giordano:

Enclosed are the analytical results for sample(s) received by the laboratory on May 11, 2018. The results relate only to the samples included in this report. Results reported herein conform to the most current, applicable TNI/NELAC standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Samantha Bayura

QUALIFIERS

Project: Valley Village - QTR
Pace Project No.: 30252655

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-PA Pace Analytical Services - Greensburg
