1.0 INTRODUCTION

This Limited Phase II Environmental Site Assessment Report (Report) has been prepared by RETTEW Associates, Inc. on behalf of Herr Foods, Inc. (Herr's), to document environmental assessment activities conducted at Herr's manufacturing facility (Site), located at 273 Old Baltimore Pike in West Nottingham Township, Chester County, Pennsylvania. A Site location map is included as **Figure 1**.

A previous Phase I Environmental Site Assessment (ESA) conducted at the Site by RETTEW in April 2014 identified several recognized environmental conditions (RECs) associated with both past and current land uses. The identified RECs include the following:

- A former 15,000-gallon heating oil underground storage tank (UST) known as Tank 001;
- Existing USTs - Tanks 002 (20,000-gallon caustic solution railcar), 008 (10,000-gallon gasoline) and 009 (10,000-gallon diesel);
- The floor drains and septic system associated with the Truck Garage;
- Five subgrade hydraulic lifts located in the Truck Garage and Visitor's Center; and
- The former on-lot septic disposal system located adjacent to the Visitor's Center.

The purpose of this Limited Phase II ESA was to investigate current soil quality at each REC and compare results to applicable remediation standards. The findings were used to develop recommendations for corrective action in accordance with Pennsylvania's Land Recycling and Remediation Standards Act (Act 2) standards, PA Code, Title 25, Chapter 250 titled *Administration of the Land Recycling Program*, and PA Code, Title 25, Chapter 245 titled *Administration of the Storage Tank Spill and Prevention Act*.

2.0 SITE DESCRIPTION AND BACKGROUND

The Site is a 13.8-acre property owned and operated by Herr's and historically for snack food manufacturing. The Site is improved with three permanent structures: the main manufacturing facility (known as Nottingham Plant 1), a wastewater treatment plant (WWTP) and a Truck Garage. Paved access drives, parking lots and grass lawn areas cover the remainder of the Site as shown on **Figure 2**.

Nottingham Plant 1 is a 312,000 square-foot manufacturing plant and originally began as a much smaller building in the early 1950's. Various additions/modifications occurred thereafter in 1963, 1967, 1977, 1979, 1980, 1983, 1986, 1989, 1998, and 1992. Nottingham Plant 1 contains a Visitor's Center on the northwest side of the facility, and office space in the middle of the facility. The southern portion of the facility is a truck washing/maintenance area, with the remainder of the facility being in production or warehouse. The facility is served by a water supply well operated by Herr's on an adjacent parcel south of the Site.

Sanitary and process wastewater generated at Nottingham Plant 1 is treated at the WWTP, which was constructed in 1978. The WWTP is located on the eastern side of the property adjacent to the truck washing/maintenance area. Treated wastewater is discharged off-site to a land application facility in accordance with a Pennsylvania Department of Environmental Protection (PADEP) Part II Water Quality Permit.

The Truck Garage was built in 1978 and is located on the southern end of the Site. This building is used for the maintenance of Herr's fleet vehicles and includes regulated UST systems, dispensers, and a gasoline and diesel fueling station. The UST systems include a 10,000-gallon gasoline tank (Tank 008) and a 10,000-gallon diesel tank (Tank 009). These tanks were installed in 1997 and replaced five USTs (Tank 003 through Tank 007). During the removal, petroleum impacted soil was encountered and

removed. A closure report submitted to the PADEP dated July 2, 1997 detailing the removal of Tank 003 through Tank 007. In correspondence dated November 17, 1997, PADEP indicated that they accepted the Closure Report, and that "no further action is required regarding the closure of the tanks". Four sub-slab hydraulic lifts are located within the service bays of the Truck Garage for vehicle maintenance. The Truck Garage utilizes a well for water supply, and wastewater is discharged to an on-lot septic system and drainfield located on the south and east side of the garage.

2.1 PHASE I ESA SUMMARY

A Phase I Environmental Site Assessment (ESA) conducted at the Site by RETTEW in April 2014 to satisfy environmental due diligence as part of loan application package. The Phase I ESA identified several RECs associated with both past and current land uses that warranted further evaluation. These RECs were identified as follows.

Former Septic System – Nottingham Plant 1: According to Herr's personnel, Nottingham Plant 1 was previously served by an on-lot septic system located in the northwest portion of the Site just south of the Visitor's Center. The former septic system has since been abandoned.

Former Hydraulic Lift – Nottingham Plant 1: According to Herr's personnel, Nottingham Plant 1 had a vehicle maintenance garage prior to facility expansion where the Visitor's Center is currently located. It was reported that the garage contained a subgrade hydraulic lift.

Former 15,000-gallon heating oil UST (Tank 001) - Nottingham Plant 1: Herr's personnel indicated this UST was removed, but no closure or location documentation was available.

Existing 20,000-gallon caustic UST (Tank 002) - Nottingham Plant 1: This UST was reported to be part of the wastewater treatment system. Herr's personnel indicated that the UST is a buried railroad car that is no longer in service, but has not been removed. Tank 002 was replaced with a 4,500-gallon AST located inside the facility. According to Herr's personnel, the UST is full of water.

Floor Drains and Septic System – Truck Garage: Several trench-style floor drains are located within the Truck Garage. According to Herr's personnel, the floor drains previously discharged to the on-lot septic system.

Based on the identified RECs, RETTEW recommended a limited investigation of soil quality in the vicinity of the RECs to confirm the presence or absence of environmental impacts. In addition, RETTEW recommended the collection of a water sample from the supply well at the Truck Garage for laboratory analysis.

3.0 GEOLOGIC AND HYDROGEOLOGIC SETTING

According to publications of the Pennsylvania Bureau of Topographic and Geologic Survey¹, the Site is located in the Piedmont Upland Section of the Piedmont Physiographic Province of Pennsylvania, and is underlain by complexly folded and faulted schist, gneiss, quartzite and some saprolite. Local topography is characterized by broad, rounded to flat-topped hills and shallow valleys. According to the USGS 7.5-minute Rising Sun Quadrangle (**Figure 1**), the Site is situated at an approximate elevation of 540 feet. Surface topography slopes gently to the southeast. An unnamed tributary (UNT) of North East Creek is located approximately 1,000 feet southeast of the Site and flows generally to the south and southeast.

¹ W.D. Sevon, 2000, Map 13, *Physiographic Provinces of Pennsylvania*, Pennsylvania Bureau of Topographic and Geologic Survey, Harrisburg, Pennsylvania.

Soils mapped on-site by the U.S. Department of Agriculture (USDA) Soil Conservation Service's Web Soil Survey are described as the Glenelg silt loam, 3 to 8 percent slopes (GgB), the Glenville silt loam, 3 to 8 percent slopes (GIB), the Urban land, 0 to 8 percent slopes (UrB), and the Urban land-Glenelg complex, 0 to 8 percent slopes (UrmB)². The Urban land map units are comprised of highly disturbed or worked soils that show the effects of earth grading and compaction. Urban land is mapped over the majority of the Site.

The Glenelg soil series consists of very deep, well drained soils formed in residuum weathered from micaceous schist on uplands of the Blue Ridge and the Northern Piedmont. Depth to bedrock is six to 10 feet or more. Saturated hydraulic conductivity is moderately high in the subsoil and moderately high to high in the substratum.

The Glenville soil series consists of very deep moderately well drained or somewhat poorly drained soils formed primarily in colluvium or residuum affected by soil creep that is weathered from phyllite, micaceous schist, granitic gneiss and other acid crystalline rocks. Depth to bedrock is more than five feet. The profile contains a dense, restrictive horizon called a fragipan that restricts root and water movement. Saturated hydraulic conductivity is moderately low to moderately high.

The geology mapped by the Chester County Water Resources Authority, in cooperation with the USGS³, indicates that the Site is underlain by the Wissahickon Schist of the Glenarm Supergroup (see **Figure 3**). The Wissahickon Schist is described as light to medium gray schist and gneiss. The rocks of the Glenarm Supergroup surround massifs of older pre-Cambrian felsic and ultramafic gneiss basement rock. Ultramafic rock (i.e., serpentinite) associated with the Baltimore Mafic Complex is mapped approximately 1,000 feet south of the Site.

In the area of the Site, the fractured bedrock aquifers are characterized as crystalline rocks (Wissahickon Schist³). In the crystalline rocks, groundwater moves through the granular primary porosity of the weathered saprolite to a network of interconnected secondary fractures and joints in the bedrock aquifer. The groundwater flow systems are local and discharge to streams. Groundwater flows from areas of higher elevation to adjacent streams and flow paths tend to be short. Groundwater basins and surface water basins tend to coincide. Crystalline rock aquifers are generally under water-table (unconfined) conditions and the water table generally mimics surface topography.

4.0 SITE ASSESSMENT METHODS

4.1 GEOPHYSICAL SURVEY

RETTEW contracted Atlantic Leak Detection & Utility Locating of Boothwyn, Pennsylvania, to locate and markout underground utilities and metallic UST anomalies utilizing ground penetrating radar (GPR) and electromagnetic (EM) methods at the Site on October 9, 2014. The purpose of the survey was to locate potential subsurface utility conflicts in the area of the RECs prior to installing soil borings. During the GPR survey, no UST systems were detected in the area of Tank 001.

A discontinuous, linear anomaly was detected with GPR in the area of the former septic system. The anomaly was detected exiting the west side of Nottingham Plant 1, where it terminated abruptly. The anomaly was assumed to be decommissioned piping associated with the former septic system.

²Soil Survey Staff, Natural Resources Conservation Service, United States Department of Agriculture. Web Soil Survey. Available online at <http://websoilsurvey.nrcs.usda.gov/app/> accessed [November 3, 2014].

³ Sloto, R., 1994, Geology, Hydrology, and Ground-Water Quality of Chester County, Pennsylvania, Chester County Water Resources Authority, Water Resource Report 2, West Chester, Pennsylvania.

The EM survey in the area of the Tank 002 (20,000-gallon buried railcar tank) confirmed the presence of multiple electrical conduits on both sides of the tank. Due to the presence of electrical utilities, the water line into Nottingham Plant 1, and the wastewater main on the south side of the tank to the WWTP, the proposed soil boring in the area of Tank 002 was not installed.

During the geophysical survey, the discharge of the Truck Garage shop floor drain was traced to a large sub-slab pit under the south garage bay (see **Figure 4**) using flowing water. The discharge line from the pit was traced to a septic tank on the south side of the Truck Garage using GPR. Flowing water was then added to the pit and observed to enter the on-lot septic system at the two septic lids (**Figure 4**). Flow was also observed at the two septic lids when the restroom toilet was flushed several times. Based on the observed flows, the restroom, floor drains, and pit discharge to the septic drainfield located east of the Truck Garage.

4.2 SOIL BORING INSTALLATION AND SOIL SAMPLE ANALYSIS

On October 16, 2014, 10 soil borings (identified as SB-1 through SB-10) were advanced at the Site to investigate soil quality using track-mounted, direct-push Geoprobe® tooling provided by Odyssey Environmental Services, Inc. of Harrisburg, Pennsylvania. Soil boring locations were selected based on the criteria listed in the following table.

Soil Boring	REC/Location	Rationale
SB-1	Former septic system	South (downgradient) side of former septic system.
SB-2	Former Tank 001	East side of former UST.
SB-3	Former Tank 001	North side of former UST.
SB-4	Former Tank 001	West side of former UST.
SB-5	Former hydraulic lift	East (downgradient) side of former hydraulic lift.
SB-6	Truck Garage hydraulic lift	North exterior side of eastern hydraulic lift.
SB-7	Truck Garage hydraulic lift	North exterior side of central hydraulic lift.
SB-8	Truck Garage hydraulic lift	North exterior side of western hydraulic lift.
SB-9	Truck Garage floor drains	West (upgradient) side of septic drainfield.
SB-10	Truck Garage floor drains	East (downgradient) side of septic drainfield.
SB-11	Tank 002	Boring not installed due to utility conflicts.

RETTEW personnel documented the lithology encountered in each soil boring and field-screened the soil using a photoionization detector (PID) to detect the presence of volatile organic petroleum compounds. The soil borings were advanced to a terminal depth of 20 feet, with the exception of SB-3, SB-4 and SB-5, which were terminated at equipment refusal. Equipment refusal ranged from 11 to 18 feet below grade. Lithology encountered consisted of asphalt, sub-base and gravel fill, and soils were generally classified by RETTEW as micaceous silt and sand overlying saprolitic schist and gneiss. Perched groundwater was noted in all borings except SB-1 and SB-3 at depths ranging from five feet (SB-10) to 16 feet (SB-2 and SB-5). Soil boring logs documenting field observations are provided in **Appendix A**.

The soil sample with the highest PID reading in each soil boring was submitted for laboratory analysis. A soil sample was collected at the terminal depth in the borings where PID readings were less than one part per million (ppm). The observed PID readings were generally less than 10 ppm, with the exception of SB-6 (234 ppm at 10 feet below grade), SB-7 (252 ppm at eight feet below grade) and SB-8 (214 ppm at seven feet below grade) at the Truck Garage. Each soil sample was preserved in the field, placed in a cooler with ice, and delivered to Lancaster Laboratories Environmental (LLE) of Lancaster, Pennsylvania, following standard chain-of-custody procedures. Soil samples collected at the Site were submitted for the following laboratory analyses.

Soil Boring	REC/Location	Sample Analyses
SB-1	Former septic system	Priority Pollutant List VOCs/SVOCs/metals
SB-2	Former Tank 001	PADEP Short List of Petroleum Products for fuel oil #2
SB-3	Former Tank 001	PADEP Short List of Petroleum Products for fuel oil #2
SB-4	Former Tank 001	PADEP Short List of Petroleum Products for fuel oil #2
SB-5	Former hydraulic lift	PADEP Short List of Petroleum Products for lubricating oils
SB-6	Truck Garage hydraulic lift	PADEP Short List of Petroleum Products for lubricating oils
SB-7	Truck Garage hydraulic lift	PADEP Short List of Petroleum Products for lubricating oils
SB-8	Truck Garage hydraulic lift	PADEP Short List of Petroleum Products for lubricating oils
SB-9	Truck Garage floor drains	Priority Pollutant List VOCs/SVOCs/metals
SB-10	Truck Garage floor drains	Priority Pollutant List VOCs/SVOCs/metals

Notes

VOCs = Volatile organic compounds

SVOCs = Semi-volatile organic compounds

Laboratory analytical reports are included as **Appendix B**. A soil sample analytical data summary for organic substances is presented as **Table 1**. A soil sample analytical data summary for inorganic substances is presented as **Table 2**.

4.3 GROUNDWATER SAMPLING AND ANALYSIS

RETTEW collected a groundwater sample from the supply well at the Truck Garage on October 16, 2014. The sample was collected at the utility sink inside the Truck Garage. Prior to sample collection, the spigot was opened and allowed to flow for 15 minutes to purge standing water from the system. Following purging, groundwater samples were collected directly into laboratory bottleware, placed in a cooler with ice, and delivered following standard chain-of-custody procedures to LLE for laboratory analysis. The groundwater sample was analyzed for Priority Pollutant List VOCs, SVOCs and metals. The groundwater sample laboratory analytical report is included as **Appendix B**.

5.0 SOIL QUALITY

Soil sample analytical results for organic substances (**Table 1**) shows that benzene was detected in two borings (SB-7 and SB-8) at concentrations exceeding the Act 2 non-residential Statewide Health Standard of 0.5 milligrams per kilogram (mg/kg). Naphthalene was detected in SB-8 at a concentration exceeding the Act 2 non-residential Statewide Health Standard of 25 mg/kg. Generally, most of the Short List Products for lubricating oils were detected at SB-7 and SB-8 at concentrations below the non-residential Statewide Health Standards. Benzene, naphthalene, fluorine, phenanthrene and pyrene were also detected at SB-6 at concentrations below the Act 2 non-residential Statewide Health Standards. It is noted that benzene was detected at a concentration below the non-residential Statewide Health Standard at SB-10. No organic substances were detected in the other soil borings.

The detected concentrations of benzene at SB-7 and SB-8 exceed their soil-to-groundwater Medium Specific Concentrations (MSCs) protective of groundwater. Similarly, the detected concentration of naphthalene at SB-8 exceeds its soil-to-groundwater MSC. This suggests that benzene and naphthalene could potentially leach from the soil to the groundwater at concentrations exceeding their respective groundwater MSCs. The occurrence of VOCs (i.e., benzene and naphthalene) downgradient of the UST system also suggests that the UST system could potentially be a source for the soil impacts. The detection of benzene at SB-10 suggests that VOCs may be entering the septic drainfield via the Truck Garage floor drains and pit.

Soil sample analytical results for inorganic substances (**Table 2**) shows that several metals were detected in samples collected from SB-1, SB-9, and SB-10; however, all detected concentrations are below their applicable Act 2 non-residential Statewide Health Standards. The concentrations of detected metals at SB-9 and SB-10 (near the Truck Garage septic drainfield) are generally higher compared to concentrations of detected metals at SB-1. This further suggests that metals may be entering the on-lot septic system via the Truck Garage floor drains and pit.

6.0 GROUNDWATER QUALITY

Groundwater analytical results for the water supply well indicate that organic substances were not detected in the sample collected. The only inorganic substances detected were copper and zinc, which were present at concentrations of 0.0053 mg/l and 0.0244 mg/l, respectively. These concentrations are below the Act 2 non-residential Statewide Health Standard for copper of 1.0 milligrams per liter (mg/l) and zinc (2.0 mg/l).

7.0 CONCLUSIONS AND RECOMMENDATIONS

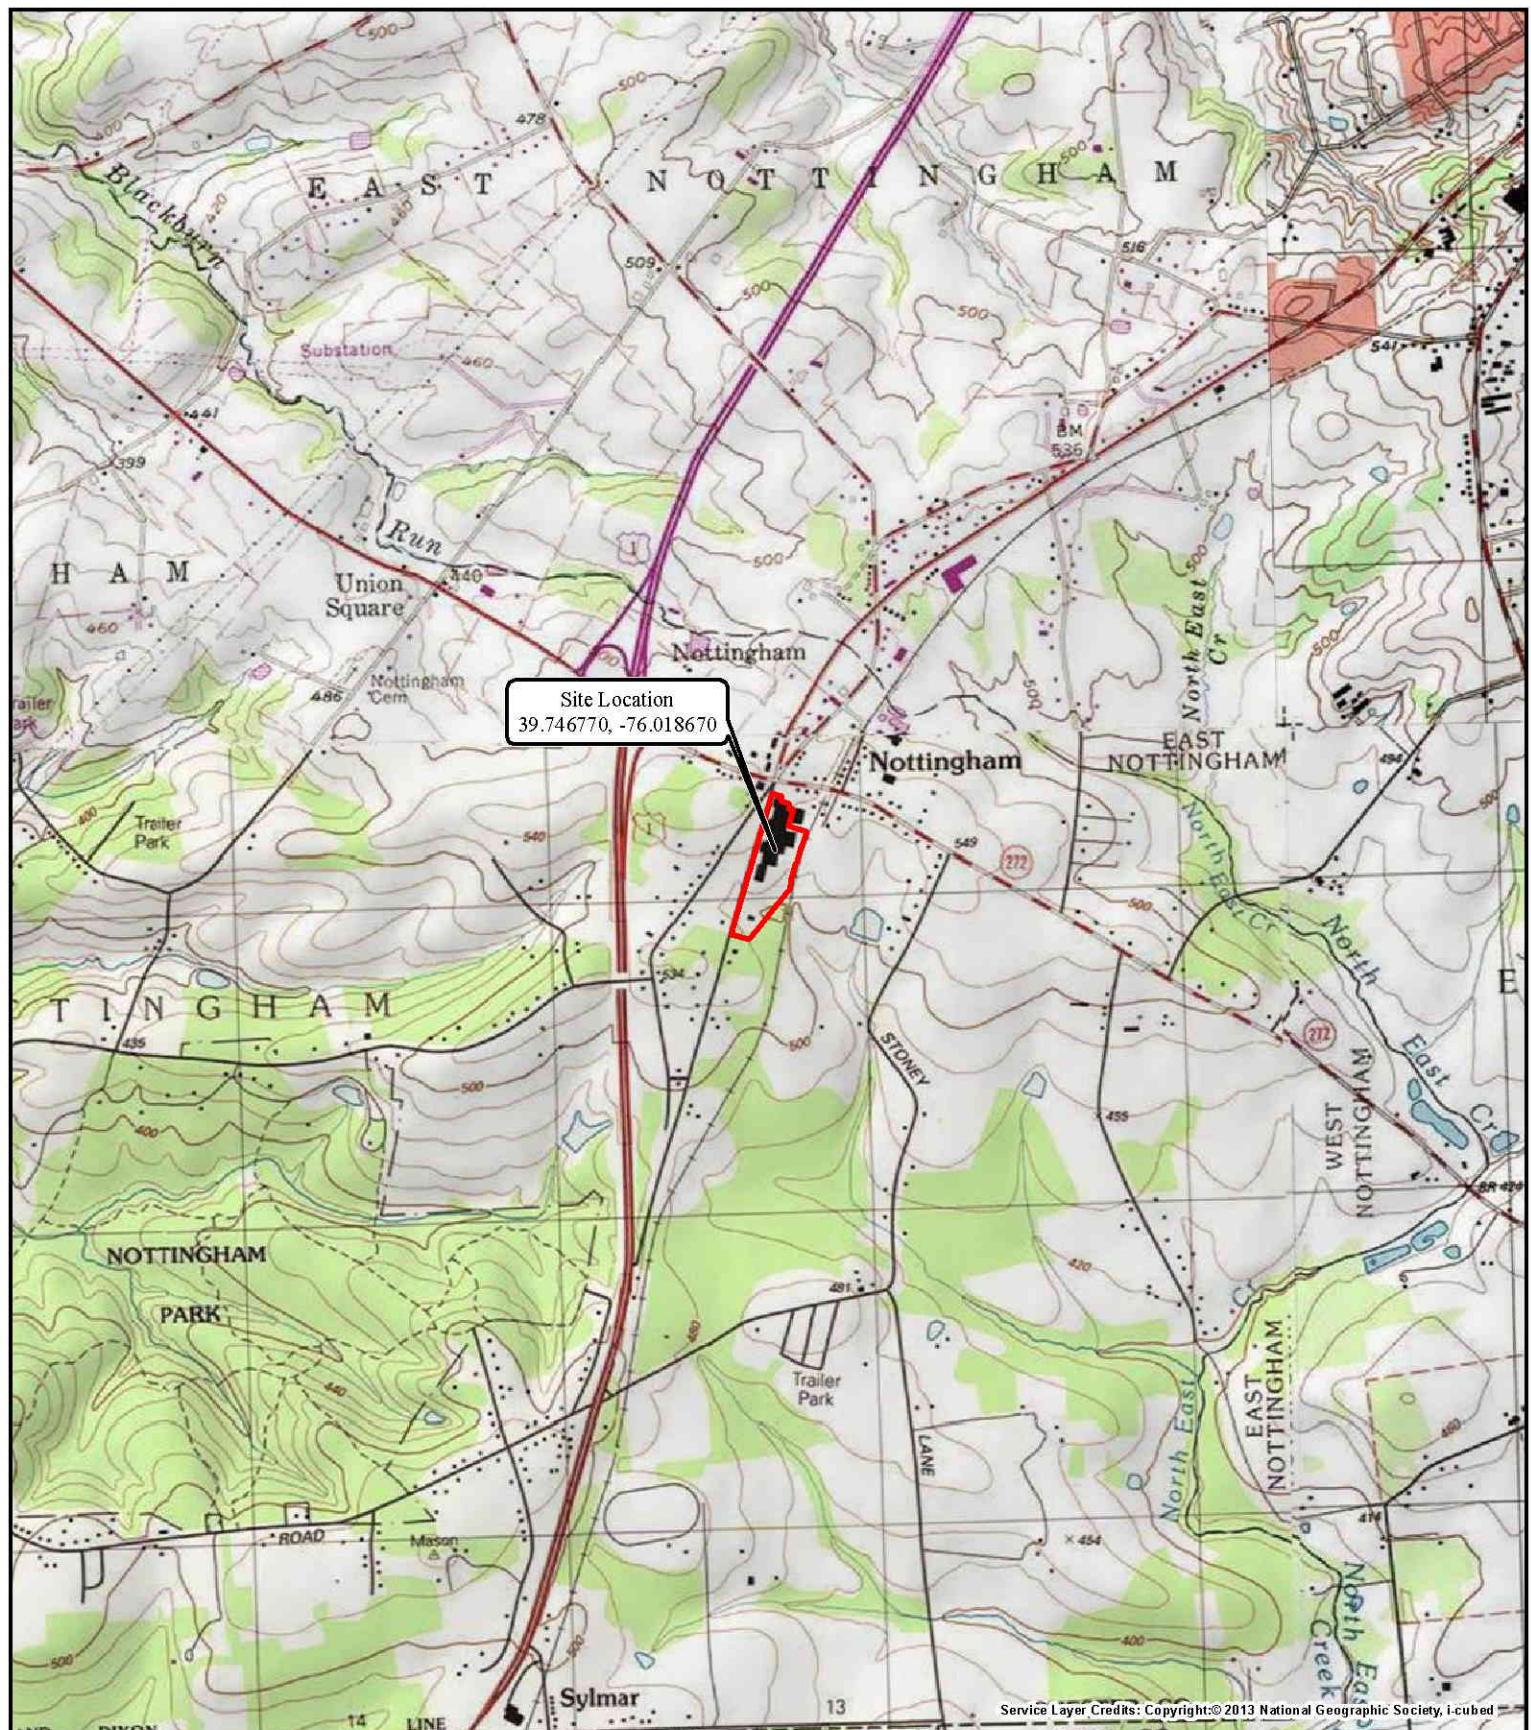

The findings of the Limited Phase II ESA performed by RETTEW at the Site indicate that current soil quality does not meet the Act 2 non-residential Statewide Health Standards for benzene and naphthalene on the north side of the Truck Garage. Benzene and naphthalene exceed their soil-to groundwater MSCs. This condition is reportable to the PADEP. RETTEW recommends that Herr's follow PADEP's release reporting protocols.

A horizontal and vertical soil quality assessment is also recommended to investigate the extent of petroleum impacts at the Truck Garage. This should include a sufficient number of soil borings upgradient (i.e., around the current UST system) and downgradient to determine the full extent of soil impacts. Although organic substances were not detected in the water supply well at the Truck Garage, a groundwater quality assessment is recommended to confirm groundwater quality and delineate the extent of dissolved-phase petroleum groundwater impacts. If the current regulated UST system is determined to be the source of the soil impacts, site characterization (i.e., soil and groundwater quality assessment) must follow the corrective action process of Chapter 245.

The findings of the Limited Phase II ESA also indicate that the Truck Garage floor drains and pit discharge to the on-lot septic system. This condition could potentially result in a discharge of regulated substances to the environment. RETTEW recommends that wastewater contained in the pit be recovered and disposed properly off-site, and that the floor drains and pit be grouted and permanently closed to prevent future discharges.

Tank 002 (20,000-gallon buried railcar tank) was not investigated during the Limited Phase II ESA due to potential conflicts with underground utilities surrounding the tank. RETTEW understands that Tank 002 is no longer in use and has been replaced with a 4,500-gallon AST located inside Nottingham Plant 1. Closure of Tank 002 is recommended in accordance with PADEP protocols for regulated tank systems.

Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.					

General Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/15.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

2-Chloroethyl vinyl ether is an acid labile compound and cannot be reported due to acid preservation of the samples and standards in this method.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:

The sample was re-analyzed and the QC is again outside of the acceptance limits, indicating a matrix effect. The data is reported from the initial trial.

General Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/15.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Laboratory Sample Analysis Record

CAT No.	Analysis Name	Method	Trial#	Batch#	Analysis Date and Time	Analyst	Dilution Factor
10335	PPL/TCL Volatiles in Water	SW-846 8260B	1	Y142941AA	10/21/2014 15:21	Angela D Sneeringer	1
01163	GC/MS VOA Water Prep	SW-846 5030B	1	Y142941AA	10/21/2014 15:21	Angela D Sneeringer	1

Quality Control Summary

Client Name: Rettew Associates
Reported: 10/27/14 at 12:36 PM

Group Number: 1511613

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification

(1) The result for one or both determinations was less than five times the LOQ.

(2) The unspiked result was more than four times the spike added.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

RL	Reporting Limit	BMQL	Below Minimum Quantitation Level
N.D.	none detected	MPN	Most Probable Number
TNTC	Too Numerous To Count	CP Units	cobalt-chloroplatinate units
IU	International Units	NTU	nephelometric turbidity units
umhos/cm	micromhos/cm	ng	nanogram(s)
C	degrees Celsius	F	degrees Fahrenheit
meq	milliequivalents	lb.	pound(s)
g	gram(s)	kg	kilogram(s)
µg	microgram(s)	mg	milligram(s)
mL	milliliter(s)	L	liter(s)
m³	cubic meter(s)	µL	microliter(s)
		pg/L	picogram/liter

< less than - The number following the sign is the limit of quantitation, the smallest amount of analyte which can be reliably determined using this specific test.

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg), or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Data Qualifiers:

C – result confirmed by reanalysis.

J - estimated value – The result is \geq the Method Detection Limit (MDL) and < the Limit of Quantitation (LOQ).

U.S. EPA CLP Data Qualifiers:

Organic Qualifiers

- A** TIC is a possible aldol-condensation product
- B** Analyte was also detected in the blank
- C** Pesticide result confirmed by GC/MS
- D** Compound quantitated on a diluted sample
- E** Concentration exceeds the calibration range of the instrument
- N** Presumptive evidence of a compound (TICs only)
- P** Concentration difference between primary and confirmation columns $>25\%$
- U** Compound was not detected
- X,Y,Z** Defined in case narrative

Inorganic Qualifiers

- B** Value is <CRDL, but \geq IDL
- E** Estimated due to interference
- M** Duplicate injection precision not met
- N** Spike sample not within control limits
- S** Method of standard additions (MSA) used for calculation
- U** Compound was not detected
- W** Post digestion spike out of control limits
- * Duplicate analysis not within control limits
- + Correlation coefficient for MSA <0.995

Analytical test results meet all requirements of NELAC unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff. This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR part 136 Table II as "analyze immediately" are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.
