1.0 INTRODUCTION

This Third Quarter 2018 Remedial Action Progress Report (RAPR) has been prepared by RETTEW Associates, Inc. on behalf of Herr Foods, Inc. (Herr's), to document remedial action activities conducted during the Third Quarter of 2018 at Herr's manufacturing facility, located at 273 Old Baltimore Pike in West Nottingham Township, Chester County, Pennsylvania (Facility ID No. 15-24418) (referred to herein as the Site). A Site location map is included as **Figure 1**. This RAPR was prepared in accordance with the corrective action regulations defined in Title 25 Pennsylvania Code Chapter 245 titled *Administration of the Storage Tank and Spill Prevention Program* and the requirements of the Pennsylvania Land Recycling and Remediation Standards Act (Act 2).

The proposed remedial action is designed to reduce groundwater concentrations of benzene and methyl tert-butyl ether (MTBE) to attain the Act 2 Site-Specific Standard for groundwater at the groundwater/surface water interface and meet applicable surface water quality criteria in an unnamed tributary (UNT) to North East Creek (**Figure 1**). The remedial approach at the Site was presented in the Remedial Action Plan (RAP) prepared by RETTEW and approved by the Pennsylvania Department of Environmental Protection (PA DEP) on June 14, 2017. Remedial activities completed at the Site since the approval of the RAP include quarterly groundwater monitoring and analysis, former water supply well abandonment, and an initial round of remedial injections. The status of remediation is described in the following sections of this report. Additional detail regarding the remediation injections will be included in the remedial performance evaluation and will be submitted under a separate cover.

2.0 SITE DESCRIPTION

The remedial action described in this RAPR addresses a release of unleaded gasoline and diesel that was discovered in 1997 during underground storage tank (UST) closure activities at the Truck Garage on the southern portion of Herr's manufacturing facility (see **Figure 2**). The Truck Garage is currently used for the maintenance of Herr's fleet vehicles. The area surrounding the Truck Garage is covered with asphalt paving and is used for parking Herr's fleet trucks and trailers. The Truck Garage is connected to an off-site water supply well operated by Herr's that serves the Site, the manufacturing facility, and surrounding parcels owned by Herr's. No public or private drinking water supplies have been affected by the release.

The source area at the Site is characterized as an area of subsurface diesel and unleaded gasoline impact to saturated soil and groundwater immediately downgradient of the UST system (**Figure 3**). Petroleum impacted soil is located below the seasonally high-water table in the zone of saturation in the source area; therefore, remediation and attainment demonstration will focus on groundwater. Separate phase liquid (SPL) has been historically detected in the source area in MW-4 (**Figure 3**).

A network of 17 groundwater monitoring wells were installed at the Site and on downgradient parcels owned by Herr's to delineate the extent of groundwater impacts resulting from the release. Monitoring well locations are shown on **Figure 2** and **Figure 3**. Benzene and MTBE are the only regulated substances detected in off-site groundwater (MW-10 and MW-11) at concentrations exceeding their non-residential Act 2 Medium Specific Concentrations (MSCs). Quarterly groundwater monitoring is performed at the Site using a network of 13 wells (groundwater at MW-1, MW-2, MW-6 and MW-8 have not been impacted by the release, and these wells are not monitored).

Groundwater discharges to surface water over 300 feet downgradient from the former UST system near MW-11 forming the headwaters of the UNT to North East Creek. Benzene and MTBE have been detected in the sediment and surface water of the UNT to North East Creek. Discharging groundwater also supports wetlands at the Site.

3.0 REMEDIAL ACTION OBJECTIVES

As described in the RAP, petroleum impacted soil is present below the seasonally high-water table (i.e. soil in the zone of groundwater saturation) and will continue to leach to groundwater. Therefore, the goal of remediation is to reduce the mass of hydrocarbons present and meet surface water criteria in the UNT to North East Creek. As such, remedial action objectives (RAOs) were developed to attain the Act 2 Site-Specific Standard for groundwater and include the following:

- Remediate the source of groundwater impacts, to the extent technologically and economically feasible, to minimize or eliminate the continued degradation of groundwater in the source area
- Remediate benzene and MTBE in groundwater to meet calculated remediation endpoints for benzene and MTBE at the groundwater/surface water interface (MW-11)
- Demonstrate continued natural attenuation of the groundwater plume (plume stabilization/degradation)
- Remediate benzene concentrations in groundwater at the point of groundwater discharge (MW-11) to concentrations below the Cancer Risk Level (CRL) Wasteload Allocation (WLA) surface water quality criteria.

Remediation endpoints were calculated for benzene and MTBE in groundwater using fate and transport models presented in the RAP. Calculated remediation endpoints for benzene and MTBE in groundwater at MW-10 and MW-11 are provided in the following table.

Parameter	Groundwater Value	Comments
Benzene Source Concentration	332 µg/L	SWLOAD5 back calculation
MTBE Source Concentration	1,800 µg/L	SWLOAD5 back calculation
Benzene Concentration at MW-10	155 µg/L	Calculated 100 feet from OW-2
MTBE Concentration at MW-10	818 µg/L	Calculated 100 feet from OW-2
Benzene Concentration at MW-11	14 µg/L	Calculated 255 feet from OW-2
MTBE Concentration at MW-11	216 µg/L	Calculated 255 feet from OW-2

The calculated benzene and MTBE concentrations presented above are the proposed remediation endpoints for OW-2 and to serve as target concentrations to monitor and verify remedial effectiveness at MW-10 and MW-11 for the purpose of attaining applicable surface water standards. It is noted that the fate and transport analysis presented in the RAP concluded that MTBE had reached steady state and that the WLAs are met into the future. This condition will be monitored and re-evaluated during remediation.

4.0 REMEDIAL ACTION DESCRIPTION

In-situ chemical oxidation (ISCO) was the selected remedial method for the destruction of petroleum hydrocarbons in saturated soil and groundwater. Sodium persulfate activated with sodium hydroxide was the selected oxidant for ISCO in the source and plume areas due to its proven ability to achieve significant reduction of toxicity, mobility, and mass of contaminants.

Remediation injection activities were conducted from May 15 through May 31, 2018 utilizing direct push injection technology. Injection activities were stopped due to visual observations in the UNT to North East Creek that were similar in nature to a release of injection material. Upon further review of stream monitoring and sampling data collected over an approximately one-week period, it appeared that the observations in the stream were not associated with the injection activities and were likely caused by the

groundwater containing iron entering the stream as a result of the unseasonably high precipitation. Additional detail regarding the rapid response and associated stream monitoring and sampling activities will be provided along with the remedial performance evaluation that will be submitted under a separate cover.

The remediation injection layout showing locations where injections occurred during the May event is shown in **Figure 4**. The full injection design volumes could not be achieved during injection activities due to surfacing of groundwater and injection material likely a result of soil heterogeneity and high-water table. Therefore, this initial round of injections included only partial volumes of injection material compared to the design volumes and included application to only select vertical intervals to minimize surfacing.

Partial injections were completed in each of the three distinct remediation target areas, including the area designated as the source area (referred to as Remediation Area 1 or RA1), the groundwater plume area downgradient of RA1 (referred to as Remediation Area 2 or RA2), and an area of the groundwater plume upgradient of MW-10 (referred to as Remediation Area 3 or RA3). Due to complications with injection material surfacing, continuing the remaining planned injections is currently being evaluated. A remedial performance evaluation will be performed and submitted under a separate cover.

5.0 QUARTERLY GROUNDWATER MONITORING AND SAMPLE ANALYSIS

Groundwater monitoring and sampling for the Third Quarter of 2018 was performed by RETTEW on September 17, 2018. The samples were shipped to ESC Lab Sciences (ESC) of Mount Juliet, TN for laboratory analysis. After gauging static water levels, groundwater was purged from each well with a peristaltic pump to maintain flow rates at approximately 200 milliliters per minute (ml/min) with minimal drawdown in accordance with the PA DEP *Groundwater Monitoring Guidance Manual* (December 2001) low-flow purging methods. The pump tubing was set at a depth of approximately 8 to 10 feet below grade, corresponding to the depth of the greatest observed soil impacts at the Site. Purged groundwater was routed through a flow-cell and an YSI 556 water quality meter to monitor intrinsic groundwater quality parameters including pH, conductivity, dissolved oxygen (DO), temperature, and oxidation-reduction potential (ORP). Intrinsic parameters were monitored frequently until stabilization, indicative of representative groundwater chemistry. Low flow purging and monitoring data sheets are included as **Appendix A**.

Upon intrinsic parameter stabilization, groundwater samples were collected from the pump discharge tubing. To reduce the likelihood of cross-contamination, new tubing was used and nitrile gloves were worn during the collection of each groundwater sample. Groundwater samples were collected in laboratory bottleware, placed in a cooler with ice, and shipped to ESC for analysis of PA DEP Short List parameters for unleaded gasoline and diesel fuel. The groundwater samples collected during the third quarter monitoring event were also laboratory analyzed for monitored natural attenuation (MNA) parameters nitrate, sulfate, iron, and dissolved iron. The MNA evaluation will be included in the remedial performance evaluation that will be performed and submitted under a separate cover. A summary of groundwater sample analytical data is provided as **Table 1**. Groundwater sample analytical reports are provided in **Appendix B**. A groundwater gradient map based on the monitoring data collected in September 2018 is provided as **Figure 5**.

6.0 GROUNDWATER MONITORING RESULTS

Groundwater at the Site occurs in pores and relict fractures in weathered decomposed schist saprolite overlying a fractured bedrock aquifer system. Based on static water levels measured during the September 2018 monitoring event, the water table ranges from surface to approximately 5.6 feet below ground surface across the Site. The groundwater flow pattern and hydraulic gradient is similar to past groundwater monitoring events, with an average hydraulic gradient of 0.014 toward the east/southeast as shown on **Figure 5**. Based on local topography, regional drainage patterns and interpreted fracture traces presented in the RAP, regional groundwater is expected to flow to the southeast toward North East Creek, located 6,600 feet southeast of the Site.

Groundwater sample analytical results (**Table 1**) show that most of the PA DEP Short List parameters for unleaded gasoline and diesel fuel (benzene, ethylbenzene, MTBE, naphthalene, toluene, and/or 1,2,4-TMB) were detected at concentrations exceeding their Act 2 non-residential Statewide Health Standards near the Truck Garage (i.e., source area) in groundwater from MW-3, MW-4, MW-7, MW-9, MW-10, MW-11, MW-14S, MW-14D, OW-1, and OW-2. Generally, the highest concentrations of these regulated substances were detected in OW-2 immediately downgradient of the source area. Benzene and MTBE are the only parameters detected at concentrations exceeding their Act 2 non-residential Statewide Health Standards in MW-10 and MW-11 at the downgradient property boundary (the Act 2 point of compliance [POC]). Historically, none of the PA DEP Short List parameters for unleaded gasoline and diesel fuel were detected in off-site wells MW-12 or MW-13 (see **Figure 2**).

7.0 REMEDIAL ACTION STATUS

As described above in Section 4.0, remediation injections were conducted from May 15 through May 31, 2018. On July 18, 2018, the Pennsylvania Underground Storage Tank Indemnification Fund (USTIF) notified RETTEW that additional injections would not be a reasonable expenditure of Funds and moving forward the Fund desires to competitively bid a revised remedial activity. Quarterly groundwater monitoring and reporting will continue as planned and a remedial performance evaluation will be completed summarizing the remediation injections.

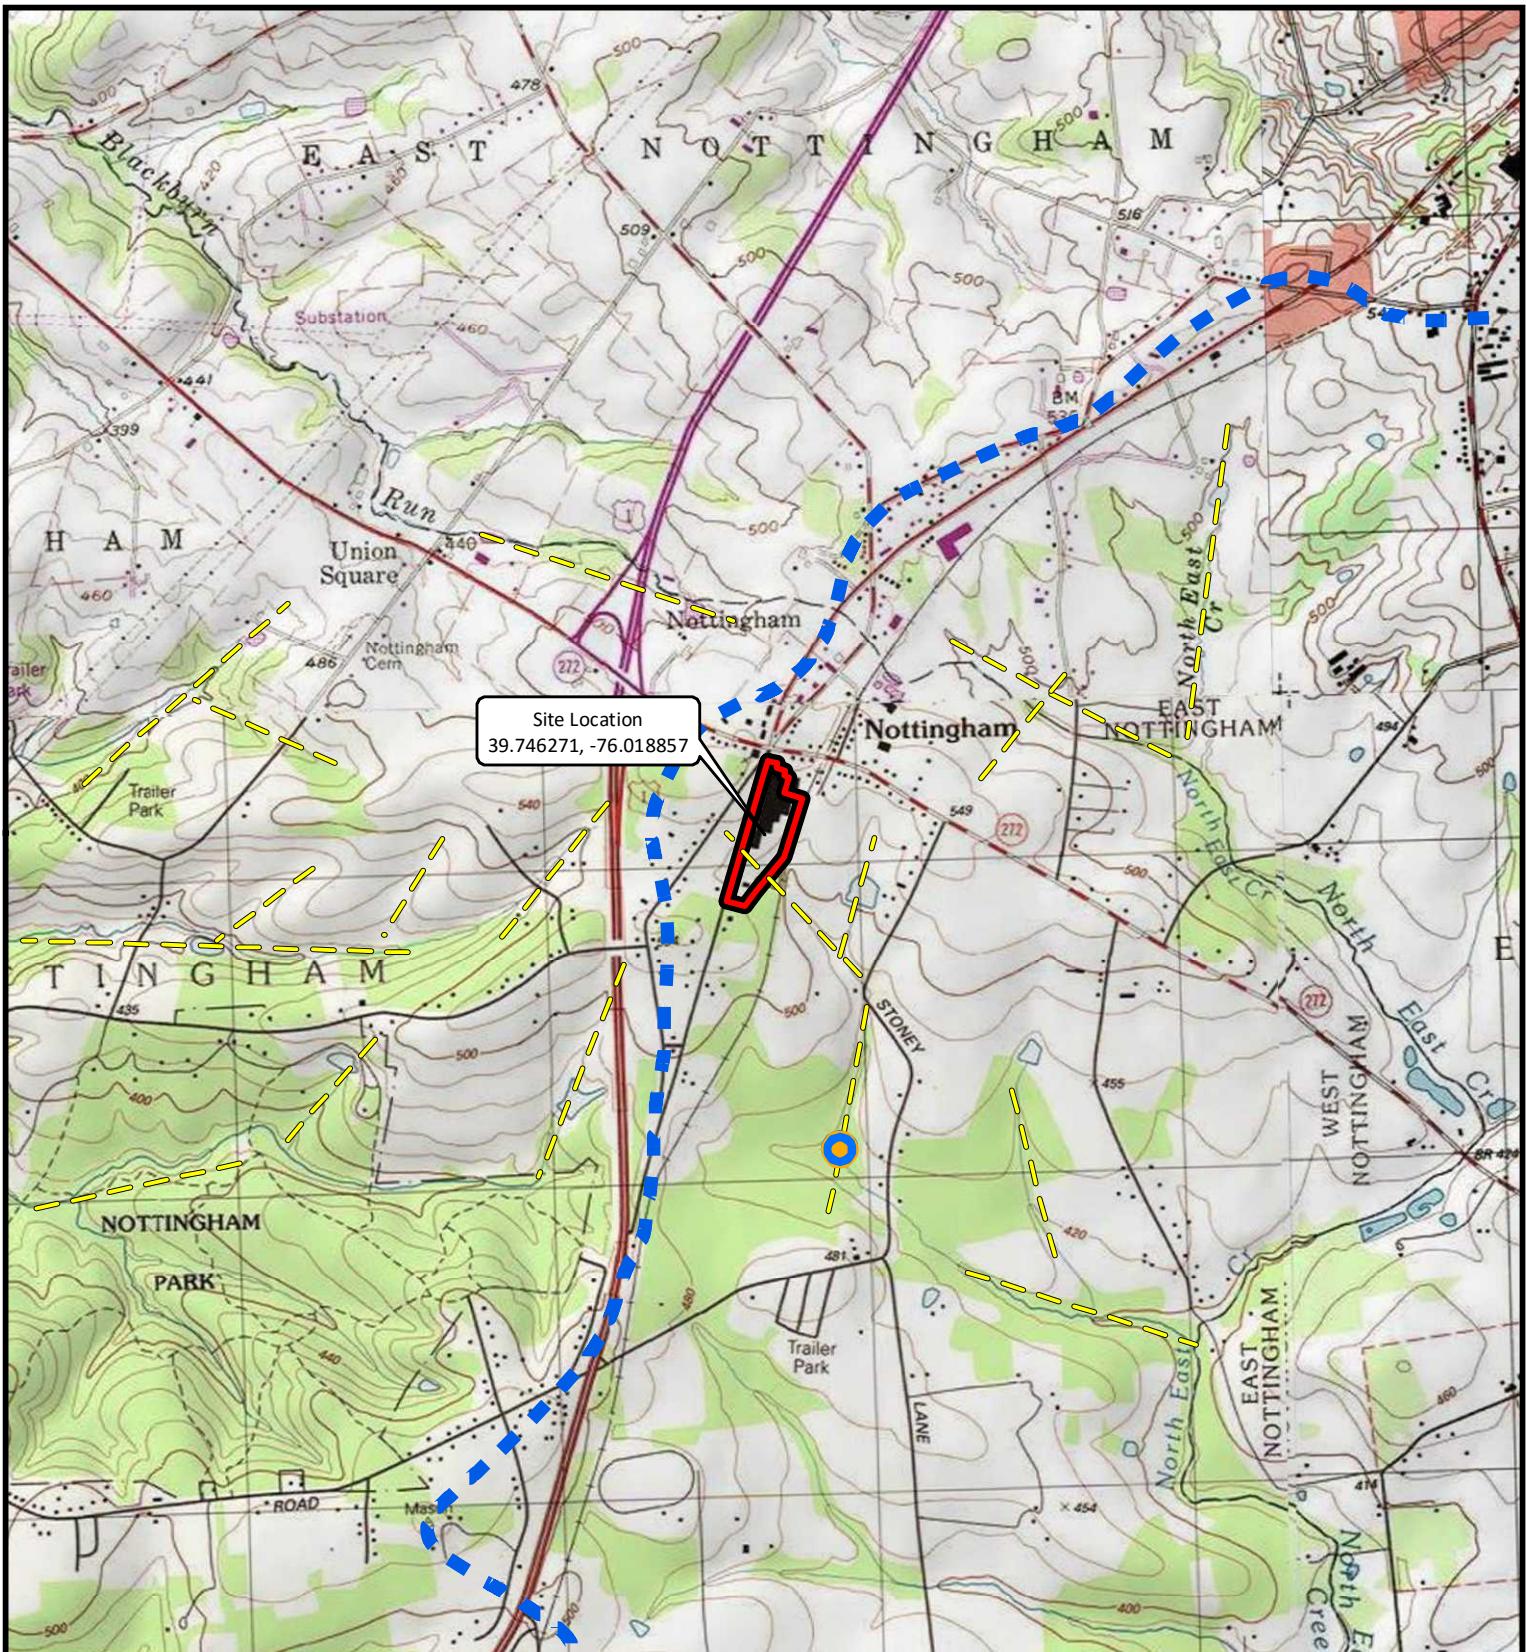

8.0 SCHEDULE

The primary tasks and anticipated schedule associated with remedial implementation are presented below. The schedule presented below is based on availability of resources and input provided by USTIF.

- Fourth Quarter 2018 groundwater monitoring – December 2018
- Fourth Quarter 2018 RAPR submittal – February 2018
- Remedial performance evaluation – January 2019 (following receipt of fourth quarter 2018 groundwater data).

Notes:

- 1) TOC = Top of casing.
 - 2) SPL = Separate phase liquid.
 - 3) All units in micrograms per liter (ug/l).
 - 4) Shaded results represent an exceedance of the applicable non-residential Statewide Health Standard.
 - 5) J = Estimated concentration detected between the method detection limit and the limit of quantitation.
 - 6) NS = Not sampled.
 - 7) NM = Not monitored.
 - 8) Adjusted water table elevation based on an assumed SPL specific gravity of 0.68.
- * Water level measured from the top of the protective casing (elevation 501.65) due to static water above TOC.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ AI
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ SC
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.
