Re: **Additional Site Characterization Report/Groundwater Monitoring Report**
Facility ID #26-18711
Rt. 119 Amoco
1809 University Drive
Dunbar, Pennsylvania 15431

Dear Ms. Kemerer:

Enclosed please find two copies of the additional Site Characterization Report/Groundwater Monitoring Report prepared by Letterle & Associates, LLC on behalf of Tim Shell for the Route 119 Amoco located in Dunbar, Pennsylvania.

Should you have any questions, please call Nate Croasmun, Project Manager at 412.486.0600 extension 306.

Sincerely,

LETTERLE & ASSOCIATES, LLC

A handwritten signature in black ink, appearing to read "Stephanie S. Profeta".

| Wells Containing LNAPL | 0 |

SITE HISTORY

Environmental characterization activities commenced at the site when evidence of a gasoline release was discovered in May 1996, due to loose swing joints and coupler connections along the piping run to the unleaded gasoline dispensers. A written notification of reportable release (NORR) was subsequently submitted to the PADEP. Previous environmental site activities were performed by Chambers Environmental (Chambers) (1996 – 2000), RETTEW (2000-2005), and Precise Tank Modifications (PTM) (2005), as described in the PADEP-approved (with modifications) 2006 SCR submitted by Letterle & Associates, LLC (Letterle). The following sections summarize the earlier activities and results.

1996-June 2000 (Chambers)

Chambers was retained as the environmental consultant in 1996 following the discovery of the unleaded gasoline release and directed the completion of 22 borings, installation of six monitor wells (MW-1 through MW-6) and two groundwater recovery wells (RW-1 and RW-2). Impact was identified within the underlying bedrock aquifer.

Chambers also completed a soil vapor extraction (SVE)/air sparging (AS) pilot test after installing three SVE wells (SVE-1 through SVE-3), two AS wells (AS-1 and AS-2), and six vapor monitoring probes (VMP-1 through VMP-6).

Chambers submitted a RAP in July 1998 proposed using SVE/AS to remove petroleum impact to the soil and groundwater to attain the PADEP Used/Non-Residential Medium Specific Concentration (U/NR MSCs) for residential, used aquifers. Initially, a SVE system would operate until the vapor concentrations declined, and AS technology would be added to remove dissolved petroleum constituents from groundwater. The RAP also noted that free product (amount not specified) was measured within SVE-3 possibly in June or early July 1998. The PADEP formally approved the RAP within a letter of correspondence dated August 24, 1998. The SVE system was activated on October 12, 1998 and the AS system was activated on March 22, 1999. Subsequently, in March 2000, PADEP requested that the RAP be reassessed due to possible volatile organic carbon (VOC) releases to air. The SVE and AS systems were deactivated on June 21, 2000.

June 2000-July 2005 (RETTEW)

In June 2000, RETTEW was retained to review the progress and effectiveness of the remedial action at the Rt. 119 site. In July 2000, RETTEW became the environmental consultant at the site. Subsequently, RETTEW modified the SVE/AS system and initiated bioaugmentation remedial methods to treat the petroleum constituents in the groundwater. According to RETTEW, the SVE system was effectively removing volatile petroleum constituents from subsurface soils in the remediation area; however, the AS system appeared to be less effective at treating the dissolved hydrocarbon phase in groundwater.

RETTEW proposed to modify the existing SVE/AS system with bioaugmentation activities including the installation of high diffusion air bubblers (HDABs) within the AS system wells (MW-1, MW-3, RW-2, SVE-2, and SVE-3) to add dissolved oxygen to the groundwater, and the addition of hydrocarbon- and MTBE-degrading enzyme complexes, nutrients, and bacterial consortium to aid in the removal of the dissolved phase constituents. Soil attainment sampling was also recommended to confirm that the SVE system had successfully removed the absorbed phase petroleum constituents from the soil.

Through August 2005, RETTEW, the PADEP, and the Shells communicated through various progress reports and correspondence regarding the site characterization and remedial action activities. The following is a summary of pertinent correspondence:

- The HDABs were apparently installed and the addition of bioaugmentation began in July 2000. One groundwater monitoring event was conducted in August 2000.
- The remedial actions recommended in the RETTEW Revised RAP were not approved by the PADEP. A new SCR/RAP was requested by the PADEP in December 2000, and remediation activities were considered to be interim remedial actions.
- On March 28, 2001, RETTEW and the PADEP met to discuss the PADEP's concerns regarding the potential for dissolved MTBE to migrate into deeper aquifer zones and to the northwest through underlying geologic structural features.
- On April 5, 2001, the PADEP issued a notice of violation and requested a new SCR/RAP.
- The PADEP reviewed the RETTEW Workplan for additional site characterization activities (geologic evaluation, deeper aquifer investigation, etc.) and the RETTEW request in May 2001 to use bioaugmentation as an interim remedial action. The PADEP did not concur with the use of bioaugmentation and requested a time frame for completion of a SCR.
- On June 12, 2001, RETTEW notified the PADEP that bioaugmentation activities would begin after July 16, 2001 as an interim remedial action until a formal RAP was approved and implemented.
- From July 23 through July 27, 2001, RETTEW directed the installation of a deep well (DW-1) at the site to evaluate the vertical extent of the dissolved phase constituents.

- RETTEW recommended a review of previous site ownership and historical aerial photography to characterize former site usage, an evaluation of the USTs compliance status, evaluation of the liquid levels within the USTs, and an evaluation of a gas chromatograph fingerprint analysis of the water/sludge sample collected from SVE-3. On July 7, 2004, each of the five USTs contained one to 12 inches of liquid. The fingerprint analysis indicated that the contaminant in the sample might contain constituents of diesel fuel and/or kerosene.
- Quarterly groundwater monitoring was performed at the site from August 2000 to July 2005. While unleaded gasoline constituents significantly decreased since remediation began, residual concentrations of benzene and MTBE above the PADEP U/NR MSCs were in several on-site wells (MW-3, RW-1, RW-2, SVE-1 through SVE-3, and AS-2).
- The remedial system was deactivated in July 2005.

January 2005 UST Closure (PTM)

In January 2005, PTM removed five USTs from the property. The PTM UST Closure Report was submitted to the PADEP in February 2005. A RETTEW representative was present during a part of the UST closure activities to observe subsurface environmental conditions in the vicinity of the UST field.

PTM documented that the USTs and approximately 100 feet of piping were in good condition with no problems. The excavated soil (approximately 86 tons) had a petroleum odor and was considered impacted. Impacted water was encountered six inches below the ground surface (bgs) in the fill material. The source of the contamination was not identified. According to RETTEW, light non-aqueous phase liquid (LNAPL) was observed on the groundwater excavation of USTs #001 through #003.

Interim remedial actions performed at the site by PTM included the removal and proper disposal of the waste from the USTs and the excavation of approximately 86 tons of petroleum-impacted soil.

August 2005-September 2006 (Letterle)

Letterle was retained by the Shells in August 2005 to complete environmental site characterization activities at the former Route 119 Amoco. A SCR was completed by Letterle and submitted to the PADEP in September 2006. A summary of site characterization activities are described as follows:

- Additional soil sampling (GB-1 through GB-19) was conducted at the site in May 2006 to further delineate soil quality at the site, and to verify if remedial actions performed at the site achieved the requirements for demonstration of attainment of the PADEP Statewide Health Standards (SHS) for soil. The analytical results of soil samples indicated that residual unleaded gasoline constituents exceeded the PADEP SHS in the overburden soil at two isolated locations in the vicinity of the former UST system area. A soil sample collected from GB-14 (0–2 feet bgs) exceeded the PADEP SHS for benzene, toluene, and naphthalene. A soil sample collected from GB-2 exceeded the naphthalene PADEP SHS.

- The PADEP informed Letterle during a February 2006 site meeting that the remedial system wells installed by Chambers were inappropriate for monitoring groundwater quality at the site. Therefore, Letterle responded by installing three additional monitor wells (MW-7 through MW-9) at the site.
- Three vapor monitor point implants (VP-1 through VP-3) were installed adjacent to the on-property building on May 9, 2006. The soil vapor results indicated that the PADEP residential and non-residential standards were exceeded in VP-2.
- The exposure pathway analysis indicated that the indirect contact from the soil pathway by inhalation is the only potential exposure pathway that currently exists at the site.

In a letter dated February 23, 2007, the September 2006 SCR prepared by Letterle was approved by the PADEP with modifications. A copy of the PADEP correspondence is included in **Appendix A**. Letterle has conducted quarterly groundwater sampling since May 2006. A summary of additional site characterization activities is described in the following sections.

ADDITIONAL SITE CHARACTERIZATION ACTIVITIES

On June 14, 2007, Letterle met with the PADEP at the site to discuss additional site characterization activities. In October 2007, additional on-site monitor wells (MW-10 and MW-11) were installed to fully delineate the release to groundwater in the northwest portion of the site. Groundwater analytical results from monitor wells MW-10 and MW-11 indicated additional delineation of the contaminant plume was necessary off-site; therefore, on September 23, 2008, Letterle installed off-site monitor well MW-12 on the Martin property located approximately 100 feet west of the site. Letterle installed an additional soil vapor point VP-4 on February 13, 2009 on the southeast corner of the Martin residence to monitor indoor air quality.

On August 24, 2010, Letterle submitted a letter to the PADEP requesting a reduction in sampling requirements so that monitor wells which had been below the PADEP SHS for at least eight quarters (i.e., MW-2, MW-6, MW-7, MW-8, and MW-9) be eliminated from the groundwater monitoring program and properly abandoned in accordance with Pennsylvania well abandonment requirements.

On September 2, 2010, Letterle met with the PADEP at the site to discuss the letter correspondence sent on August 24, 2010. The PADEP approved the abandonment of monitor wells MW-2 and MW-9; however, requested that monitor wells MW-6, MW-7, and MW-8 continue to be sampled. Letterle also gained PADEP-approval during the site visit to abandon all former site remediation wells. In addition, the PADEP requested that the extent of petroleum-impacted groundwater (identified in monitor wells MW-10 and MW-11) be delineated off-site to the west and northwest of the site and Letterle requested the PADEP confirm designation of MW-3, MW-10, and MW-11 as point of compliance (POC) wells.

Additional site characterization activities (including well abandonment activities) were completed, which included soil boring advancement, soil sampling, monitor well installations, vapor point

installations, and professional survey. Soil vapor sampling and quarterly groundwater sampling was also conducted as described in the following sections.

ADDITIONAL INVESTIGATION METHODS AND PROCEDURES

Advancement of Borings

A total of nine borings were advanced at the site from 2007 to 2010 to further characterize groundwater impact. Borings SB-10 and SB-11 were advanced on-site at the southwestern property boundary. The remaining seven borings were advanced off-site and downgradient of borings SB-10 and SB-11. All borings were installed to evaluate the vertical and horizontal extent of the unleaded gasoline release at the site (**Figure 1**). The borings were completed in four phases (note that SB-13 designation was inadvertently used twice):

- | | |
|------------------|---------------------|
| • October 2007 | SB-10 and SB-11 |
| • September 2008 | SB-12 |
| • February 2009 | SB-13/VP-4 |
| • December 2010 | SB-13 through SB-17 |

Approximately one week prior to the drilling event, the Pennsylvania One Call, Inc. was notified to alert area utility companies that subsurface work was to be conducted at the site. Prior to drilling, each pre-determined boring location was hand cleared or soft-dug with an air knife and vacuum system. A one-foot diameter by four-foot deep hole was made at each boring location.

During boring installation, soil samples were collected continuously with two-foot long split-barrel samplers to the top of bedrock (2.5 feet (MW-11) to 9 feet below ground surface (bgs) (MW-15 and MW-16). All samples were collected in accordance with ASTM D1586-99 (standard test method for penetration test). The soil samples were logged in accordance with the United Soil Classification System and were field screened for volatile organic compounds (VOCs) utilizing a photoionization detector (PID) using headspace analysis methods.

Decontamination procedures during each drilling event consisted of the setup of a decontamination pad, removal of heavy soil material from the tools, followed by a soapy water wash, potable water rinse, and air-drying. The drilling augers, air rotary rods, and rig were cleaned with a high-pressure hot water power washer prior to use at each boring location. The following sections describe the methodologies that were used to advance the borings during the various phases.

October 2007 Boring Installation

Borings SB-10 and SB-11 were advanced by Terra Testing, Inc. of Washington, Pennsylvania, under the supervision of a Letterle scientist with a truck-mounted CME-85 drill rig, utilizing a combination of hollow stem auger drilling methods to the top of bedrock and air hammer equipment to the completion of each boring.

A Letterle scientist logged the bedrock and the samples were field screened with a PID for the presence of VOCs using headspace analysis techniques. The PID results were non-detect for all soil samples collected from all borings. Borings were advanced into bedrock, which was encountered at approximately seven feet bgs. Rock cuttings were regularly collected and logged until the boring termination at 50 feet bgs. Moist conditions were encountered at 10 feet bgs in boring SB-10 and wet conditions were encountered at 50 feet bgs in boring SB-11. Soil samples collected from borings SB-10 and SB-11 were submitted to an accredited laboratory as described below. The boring logs that include the PID results are compiled in **Appendix B**.

Discarded soil samples and drill cuttings from the boring activities were collected and placed in properly labeled 55-gallon drums. Three 55-gallon drums containing waste from October 2007 were transported by the Penn Ohio Corporation to the American Waste Landfill in Waynesburg, Ohio on January 17, 2008. Waste disposal receipts are included in **Appendix C**.

September 2008 Boring Installation

Based on the data obtained from initial drilling activities and subsequent groundwater analytical data, one additional boring (SB-12) was advanced off-site in an effort to delineate the horizontal extent of the contaminant plume.

Eichelbergers, Inc. (Eichelbergers) of Somerset, Pennsylvania, under the supervision of a Letterle scientist, advanced boring SB-12 using a Schramm T450 drill rig that utilized six-inch diameter air rotary methods. Soil samples were not collected because shale bedrock was encountered at approximately five feet bgs. Wet conditions were encountered in boring SB-12 at an approximate depth of 48 ft bgs. The boring logs are compiled in **Appendix B**.

Discarded soil samples and drill cuttings from the boring activities were collected and placed in properly labeled 55-gallon drums. Four 55-gallon drums containing waste from September 2008 were transported by the Penn Ohio Corporation to the American Waste Landfill in Waynesburg, Ohio on November 24, 2008. Waste disposal receipts are included in **Appendix C**.

February 2009 Boring Installation

On February 17, 2009, one boring (SB-13/VP-4) was advanced in an effort to delineate and characterize soil vapor quality at the western off-site property near the off-site residence with a basement. The vapor point was advanced using hand auger methods. Soil samples were collected directly from the stainless steel hand auger bucket for PID readings and lithologic descriptions. A 1.25-inch diameter by 8.25-inch long PVC well screen connected to polyethylene tubing was placed near the base of the borehole. The implant was installed at a depth of seven feet bgs, which was above the saturated zone, and was subsequently completed as vapor monitoring point (VP-4). Clean, coarse filter sand was placed in the annulus around the well screen interval and extended to approximately one foot above the top of the screen. Granular bentonite was used to fill the remaining annular space to the ground surface. The polyethylene tubing was sealed at the end with a silicon membrane fitting. The vapor point implant log is included in **Appendix B** and the location is shown on **Figure 1**.

The scientist logged the soil and the samples were field screened with a PID for the presence of VOCs using headspace analysis techniques. The PID results were non-detect for all soil samples collected. A soil sample was collected from boring SB-13/VP-4 (6-7 feet bgs) and submitted to Pace for analysis of unleaded gasoline parameters [benzene, toluene, ethylbenzene, xylenes (BTEX), methyl tertiary-butyl ether (MTBE), cumene, and naphthalene] using USEPA SW-846 Method 8260B in accordance with the storage tank regulations.

Discarded portions of the soil cuttings and decontamination waste were placed in one 5-gallon bucket that was properly labeled and secured with a lid for final disposition.

December 2010 Boring Installation

Following off-site access approval during the 4th Quarter 20010, five borings (SB-13 through SB-17) were advanced at the site on December 28 and 29, 2010 in an effort to delineate unleaded gasoline impact off-site and downgradient to the southwest, west, and northwest of monitor well MW-12 (**Figure 1**).

Eichelbergers, under the supervision of a Letterle scientist, advanced borings SB-13 through SB-17 using an Ingersoll Rand T4W utilizing air rotary methods, using a 6-inch diameter tri-cone roller bit. Prior to air rotary use, soil samples were collected continuously at each location with a direct push sampling device to the top of bedrock. Bedrock was encountered within each boring at depths ranging from three feet (SB-13) to nine feet bgs (SB-15 and SB-16). At bedrock, the borings were advanced using air rotary methods to depths ranging from 30 feet below ground surface (ft bgs) (SB-14 and SB-15) to 60 ft bgs (SB-16).

A Letterle scientist logged the soil and bedrock, and the samples were field screened with a PID for the presence of VOCs using headspace analysis techniques. The PID results were non-detect for all soil samples collected from all borings. Based on field observations and PID results and because soil impact has been delineated on-site, soil samples were not collected from borings SB-13 through SB-17.

Saturated conditions were encountered in borings SB-14 and SB-15 at approximate depths of 18 and 24 feet bgs, respectively; therefore, borings SB-14 and SB-15 were terminated at 30 feet bgs to monitor the shallow bedrock aquifer. Saturated conditions were encountered in borings SB-13, SB-16, and SB-17 at approximate depths of 40, 51, and 46 feet bgs, respectively. Borings SB-13, SB-16, and SB-17 were terminated 50, 60, and 55 feet bgs, respectively, to monitor the deep bedrock aquifer. The boring logs that include the PID results are compiled in **Appendix B**.

Discarded drill cuttings from the boring installation activities were collected and placed in properly labeled 55-gallon drums. Sixteen 55-gallon drums were loaded by McCutcheon and transported to the McCutcheon Enterprises Biosolids Treatment Facility in Apollo, Pennsylvania on December 2, 2010. Waste disposal receipts are included in **Appendix C**.

Soil Sampling and Analysis

Soil samples from borings SB-10 and SB-11 during additional site characterization activities were

collected for laboratory analysis based on visual observation; PID readings; and/or were collected at the bedrock interface if PID results and visual signs did not indicate the presence of impact. Soil samples were placed in laboratory-supplied sample containers (Terracore™ samplers), labeled, and stored in a cooler with ice at a temperature of approximately 4°C for preservation. Chain of custody documentation followed standard protocol.

Soil samples were submitted to Pace Analytical Services, Inc (Pace) of Greensburg, Pennsylvania for analysis of unleaded gasoline parameters using USEPA SW-846 Method 8260B, in accordance with the storage tank regulations. The regulated unleaded gasoline parameters included BTEX, MTBE, cumene, and naphthalene.

Soil Vapor Sampling and Analysis

On April 15, 2010 and June 21, 2010, vapor samples were collected from three on-site vapor points (VP-1, VP-2, and VP-3) and one off-site vapor point (VP-4) with laboratory-certified Summa® canisters. Vapor samples were also collected on February 17, 2009 and June 6, 2009 from off-site vapor point VP-4. Prior to sampling, the VPs were purged for approximately five minutes with a PID. The soil vapor samples were submitted for analysis of unleaded gasoline parameters via USEPA SW-846 Method TO-15. The lab analysis included the following parameters: BTEX, MTBE, cumene, and naphthalene.

Installation of Monitor Wells

Borings SB-10 through SB-17 were completed as monitor wells MW-10 through MW-17, respectively. Monitor wells MW-14S and MW-15S were completed within the first encountered water bearing zone at depths ranging from 18 ft and 24 ft bgs, respectively. Monitor wells MW-10 through MW-13, MW-16, and MW-17 were completed within the second encountered water bearing zone at depths ranging from 50 feet bgs (MW-10, MW-11, MW-12, MW-13) to 60 feet bgs (MW-16).

The wells were constructed with 2-inch diameter, schedule 40 polyvinyl chloride (PVC) solid risers and 0.020-inch factory-slotted 2-inch diameter PVC well screens. Clean filter sand was added to fill the remaining annular space spanning the length of the well screen interval; the sand pack extended to approximately two feet above the top of the well screen. An approximate two-foot thick bentonite pellet seal was placed on top of the sand pack in each borehole. The remaining annular space was filled with cement-bentonite grout. The monitor wells were completed with locking caps and protected with flush-mount steel manhole covers set in a 1.5-foot square concrete pad. Monitor well construction details are included in **Appendix B**.

Monitor Well Development

Following installation, each monitor well was developed using a submersible pump to remove fine-grained material that entered the well and to ensure proper hydraulic communication with the aquifer. The development water was collected, treated with liquid-phase granular activated carbon (GAC), and discharged on-site. The GAC was subsequently transported off-site for regeneration.

Professional Survey

Letterle subcontracted Fike Associates, Inc. (Fike), of Clarion, Pennsylvania, on February 15, 2011 to professionally survey the site, monitor wells, and all pertinent site features. Fike's survey included property boundaries, utility locations, building dimensions, and selected features of adjacent properties. The monitor well top of casing (TOC) elevations are included on **Table 2** and within the well construction logs in **Appendix B**.

Well Abandonment

From September 9-13, 2010, EarthSystems, LLC, under the supervision of a Letterle scientist, abandoned a total of 15 wells and vapor points, in accordance with the PADEP well abandonment requirements.

- Four soil vapor points (VP-A through VP-D),
- Two recovery wells (RW-1 and RW-2),
- Two monitoring wells (MW-2 and MW-9),
- Two air sparge wells (AS-1 and AS-2),
- Three soil vapor extraction wells (SVE-1, SVE-2, and SVE-3),
- One deep well (DW-1), and
- One unknown/unnamed well.

Well abandonment forms were prepared by Letterle and submitted to the Pennsylvania Department of Conservation and Natural Resources, Bureau of Topographic and Geologic Survey in the 4th Quarter of 2010. Well abandonment forms were not created for soil vapor points VP-A through VP-D and the unknown well because well details were not available. Copies of the well abandonment forms are included in **Appendix D**.

INVESTIGATION RESULTS

Soil Analytical Results

The analytical results from soil samples collected during additional site characterization activities from 2007 to 2010 indicated that regulated unleaded gasoline constituents do not exceed the PADEP SHS for BTEX, MTBE, cumene, and naphthalene. The laboratory results for the soil samples are summarized on **Table 1**. The complete laboratory analytical reports are included in **Appendix E**.

The horizontal and vertical extent of unleaded gasoline constituents in the soil was delineated at the site based on visual and olfactory observations, PID results, and soil analytical data collected during the site characterization.

Soil Vapor Analytical Results

The analytical results from the soil vapor samples (VP-1 through VP-4) collected in 2009 and 2010

indicated that the concentrations of all unleaded gasoline parameters were below the PADEP Indoor Air Criteria and Odor Thresholds for residential and nonresidential properties. The results of the soil vapor analyses are summarized on **Table 3**. The complete laboratory reports are included in **Appendix E**.

Groundwater Monitoring

Groundwater gauging and monitoring from the most recent event on January 28, 2011 is described below.

Groundwater Gauging

Prior to well purging, the depth to groundwater in each well was measured using an electronic water level probe accurate to the nearest 0.01 foot. The groundwater gauging data collected during the most recent sampling event on January 28, 2011 indicated the following:

- The depth to groundwater in the deep bedrock aquifer ranged from 28.26 feet below TOC in MW-6 to 44.58 feet below TOC in MW-7.
- The depth to groundwater in the shallow bedrock aquifer ranged from 14.87 feet below TOC in MW-14S to 16.83 feet below TOC in MW-15S.
- The horizontal hydraulic gradient in the deep bedrock aquifer was approximately 0.052 ft/ft (based on groundwater elevation data for monitor wells MW-12 (1,199.14 ft) and MW-17 (1,192.46 ft))
- The apparent groundwater flow direction at the site is to the west-northwest with local mounding in the vicinity of monitor well MW-10, and to the west-southwest off-site to the west of the site (**Figure 2**).

The groundwater gauging and elevation results are on **Table 2**.

Groundwater Sampling

Sampling Methodology

Each well was purged and sampled using hand-bailing techniques with dedicated polyethylene disposable bailers. Groundwater samples were collected from monitor wells MW-4, MW-6, MW-7, MW-8, and MW-10 through MW-17. Quality Assurance/Quality Control (QA/QC) samples (consisting of trip blank and duplicate samples) were also collected during the sampling event. The groundwater samples were submitted for laboratory analysis of unleaded gasoline parameters via USEPA SW-846 Method 8260B and included BTEX, MTBE, cumene, and naphthalene.

Sampling Results

The January 28, 2011 groundwater analytical results exceeded the PADEP SHS for the following parameters:

- Benzene in one on-site well (MW-11) and two off-site wells (MW-12 and MW-14S),
- MTBE in one on-site well (MW-11) and two off-site wells (MW-12 and MW-14S), and
- Naphthalene in one on-site well (MW-11).

The groundwater sampling results are illustrated on **Figure 3** and summarized on **Table 4**. The complete laboratory analytical report is included in **Appendix E**.

Data Evaluation

The groundwater data collected for monitor wells MW-11 and MW-12 was evaluated using the Mann-Kendall statistical test. The benzene and MTBE analytical data from monitor wells MW-11 and MW-12 was evaluated using the most recent ten sampling events from December 2008 through January 2011 (most recent sampling event) (**Appendix F**). The Mann-Kendall Statistical Test is a non-parametric statistical test used to determine whether a data set indicates an increasing trend, a decreasing trend, a stable trend, or no reliable trend. The minimum data set required by the statistical test is four; however, the PADEP requests a 10 point minimum; therefore monitor wells MW-14S and MW-15S were not evaluated. A review of the Mann-Kendall statistical trend analysis spreadsheets indicates the following:

- increasing trends for benzene, MTBE, and naphthalene in on-site monitor well MW-11 and
- increasing trends for benzene and MTBE in off-site monitor well MW-12.

Furthermore, groundwater analytical data collected from monitor wells MW-11 and MW-12 with current benzene concentrations of 5 µg/l or higher and current MTBE concentrations of 20 µg/l or higher, and from monitor well MW-11 with current naphthalene concentrations of 100 µg/l or higher, were utilized to prepare graphical depictions of benzene, MTBE, and naphthalene. The graphs were prepared using analytical data concentrations from January 2008 through January 2011 (**Appendix G**). The hydrographs illustrate benzene, MTBE, and naphthalene concentration trendlines that increase, decrease, or depict no reliable trend to date as described below. A review of the groundwater versus elevation trend graphs indicates the following:

- Benzene and MTBE concentration trendlines for on-site monitor well MW-11 are increasing
- Benzene and MTBE concentration trendlines for off-site monitor well MW-12 are increasing
- Naphthalene concentration trendline for on-site monitor well MW-11 is increasing slightly

CONCLUSIONS

Environmental site characterization activities were performed in accordance with 25 Pa. Code §245.309 to evaluate soil and groundwater quality at the Former Route 119 Amoco site. The site characterization activities included advancement of borings; installation of monitor wells; and soil and groundwater sampling.

Findings of the site characterization include the following:

- Soil impact has been delineated on-site. None of the soil sample results from the site characterization activities exceeded the PADEP SHS for unleaded gasoline constituents for used residential aquifers with TDS concentrations less than 2,500 mg/l, except for two isolated locations in the vicinity of the former UST system area. A soil sample collected from GB-14 (0–2 feet bgs) exceeded the PADEP SHS for benzene, toluene, and naphthalene. A soil sample collected from GB-2 (4-6 feet bgs) exceeded the naphthalene PADEP SHS.
- A total of 13 monitor wells are currently located at the site (on-site wells MW-3, MW-4, MW-7, MW-8, MW-10, and MW-11 and off-site wells MW-6 and MW-12 through MW-17).
- Letterle completed 17 quarterly groundwater gauging and sampling events on a quarterly basis since May 2006.
- A total of 15 wells and vapor points were properly abandoned at the site per PADEP approval.
- Groundwater was encountered within the deep bedrock aquifer at depths ranging from 28.26 feet below TOC in MW-6 to 44.58 feet below TOC in MW-7 (January 28, 2011). Based on the groundwater contour elevations, the interpreted groundwater flow direction was to the west-northwest with local mounding in the vicinity of monitor well MW-10, and to the west-southwest off-site to the west of the site.
- Groundwater impact has migrated off-site to the west.

PLANNED ACTIVITIES

During a September 2, 2010 site meeting between PADEP and Letterle, PADEP requested that all future RAPRs be submitted on an annual basis. Activities currently planned for the 2nd, 3rd, and 4th Quarters of 2011 and the 1st Quarter of 2012 include:

- Quarterly groundwater gauging and monitoring of on-site monitor wells MW-3, MW-4, MW-7, MW-8, MW-10, MW-11, and off-site monitor wells MW-6 and MW-12 through MW-17

TABLE 2
MONITOR WELL GAUGING DATA
Former Route 119 Amoco
Dunbar, Pennsylvania

| Well ID | Date | TOC Elevation (ft-msl) | GW Depth (ft) | GW Elevation (ft-msl) |
|---------------|----------|---------------------------|------------------|--------------------------|
| MW-13 | 01/28/11 | 1,231.41 | 33.06 | 1,198.35 |
| MW-14S | 01/28/11 | 1,231.79 | 14.87 | 1,216.92 |
| MW-15S | 01/28/11 | 1,233.47 | 16.83 | 1,216.64 |
| MW-16 | 01/28/11 | 1,234.06 | 35.76 | 1,198.30 |
| MW-17 | 01/28/11 | 1,231.92 | 39.46 | 1,192.46 |

Notes:

TOC top of casing
 GW groundwater
 ft-msl feet above mean sea level
 (40.75/25) total depth of well from grade / screen length (feet)
 [4] monitor well diameter (inches)
 NG not gauged due to snow pile

1. Elevations are based on arbitrary survey data from RETTEW Associates, Inc.
2. Letterle & Associates, LLC resurveyed all monitor wells after the installation of MW-10 and MW-11. The corrected elevations start 10/15/07.
feet TOC - feet below top of inner casing
3. All monitor wells were professionally surveyed following installation of MW-13 through MW-17. The corrected elevations start 1/28/11.

Re: SCR Approval w/Modifications
Facility I.D. No. 26-18711
Former Route 119 Amoco
1809 University Drive
Dunbar, Pennsylvania
Fayette County

Dear Mr. & Mrs. Shell:

The Department of Environmental Protection (Department) has completed its review of the Site Characterization Report (SCR) for the above-noted site (the "Facility"), which was received in our office on September 18, 2006. This report were prepared and submitted on your behalf by your consultant, Letterle & Associates, LLC, in response to a release from the underground storage tank (UST) system at this site on January 20, 2005.

The September 18, 2006 SCR is hereby approved as submitted with the following modifications:

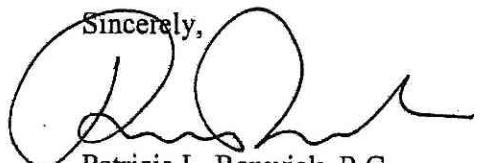

- Figure 7 (the Groundwater Contour Map) fails to provide an accurate depiction of the groundwater flow at the site. In examining the groundwater contour map, it is apparent that monitoring wells MW-3 and MW-8 have water level elevations that are anomalies for the site. The other five (5) monitoring points have water level elevations that correspond with the site surface elevation (site gently sloping towards Rt. 119 – page 2 of report). The location of the storm water drain may account for the water level anomalies. The groundwater contour maps should be re-contoured to depict accurate groundwater contours, which will in turn provide accurate groundwater flow directions and hydraulic gradients for the site. Please provide updated groundwater contour maps that accurately depict the groundwater contours, updated hydraulic gradients and accurate groundwater flow direction at the site.
- The potential for a change in the groundwater flow direction may affect the point of compliance (POC) wells for the site. Additional POC wells may be necessary in order to demonstrate attainment and provide additional data points for the Fate and Transport analysis for the site. Also, additional sampling may be necessary to support the Fate and Transport analysis for the site.

February 23, 2007

- The water levels recorded for the site do not correspond with the surface elevation for the site. The average site surface elevation is approximately 1,240 ft MSL (page 2 of the report). The groundwater elevations recorded on the Figure 7 indicate that groundwater is over 700 feet bgs. (The monitoring wells on site range in depth from 35 to 55 feet bgs). Also, the geologic cross sections provided in the report (Figures 5 and 6) also do not correspond to with the surface elevation for the site. Please provide updated groundwater contour maps and site geologic cross-sections that correspond to the appropriate site surface elevations.
- The hydraulic conductivity (K) testing was conducted at MW-3, MW-8 and MW-9. There was a large differential noted in the K value of MW-3 versus the K values for MW-8 and MW-9, therefore the hydraulic conductivity value for the site was calculated by averaging the values for MW-8 and MW-9 only. The K values are then used to determine groundwater velocity for the site. Please provide additional hydraulic conductivity data from additional data points on site in order to calculate a more statistically accurate K value average for the site.
- The K values and hydraulic gradients are applied to provide a groundwater velocity value for the site. Please provide updated information on the groundwater velocity for the site.
- The Fate and Transport models (QD) provided in the report will need to be recalculated based on the changes in the input parameters for K, V, and i. Please provide this updated information.

If you have any questions, please contact me at 412-442-5240.

Sincerely,

Patricia L. Renwick, P.G.

Laboratory Analytical Reports

March 04, 2009

Mr. Louis Letterle
Letterle & Associates
2859 Oxford Boulevard
Suite 110
Allison Park, PA 15101

RE: Project: 031 Rte 119
Pace Project No.: 305611

Dear Mr. Letterle:

Enclosed are the analytical results for sample(s) received by the laboratory on February 19, 2009. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel Christner

RE: Project: 031 Rte 119
Pace Project No.: 305618

Dear Mr. Letterle:

Enclosed are the analytical results for sample(s) received by the laboratory on February 19, 2009. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel Christner

QUALIFIERS

Project: 031 Rt. 119 Amoco
Pace Project No.: 3029875

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

RE: Project: 031 Route 119 Amoco
Pace Project No.: 3030125

Dear Mr. Letterle:

Enclosed are the analytical results for sample(s) received by the laboratory on June 25, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel Christner

QUALIFIERS

Project: 031 Route 119 Amoco
Pace Project No.: 3030125

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

LABORATORIES

PASI-PA Pace Analytical Services - Greensburg

ANALYTE QUALIFIERS

M0 Matrix spike recovery and/or matrix spike duplicate recovery was outside laboratory control limits.

R1 RPD value was outside control limits.

RE: Project: 031 Rt 119 Amoco
Pace Project No.: 3033151

Dear Mr. Letterle:

Enclosed are the analytical results for sample(s) received by the laboratory on August 30, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel Christner

RE: Project: 031 Route 119 Amoco
Pace Project No.: 3039007

Dear Mr. Letterle:

Enclosed are the analytical results for sample(s) received by the laboratory on December 21, 2010. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

David A. Pichette for
Rachel Christner

QUALIFIERS

Project: 031 Route 119 Amoco
Pace Project No.: 3039007

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

Allison Park, PA 15101

RE: Project: 031 Route 119
Pace Project No.: 3040678

Dear Mr. Croasmun:

Enclosed are the analytical results for sample(s) received by the laboratory on January 28, 2011. The results relate only to the samples included in this report. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Rachel Christner

rachel.christner@pacelabs.com

QUALIFIERS

Project: 031 Route 119
Pace Project No.: 3040678

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is NELAP accredited. Contact your Pace PM for the current list of accredited analytes.

CHAIN-OF-CUSTODY / Analytical Request Document

The Chain-Of-Custody is a LEGAL DOCUMENT. All relevant fields must be completed accurately.

Mann-Kendall Statistical Tests

**State of Wisconsin
Department of Natural Resources
Remediation and Redevelopment Program**

**Mann-Kendall Statistical Test
Form 4400-215 (2/2001)**

Notice: This form is the LNR supplied spreadsheet referenced in Appendices A of Comm 46 and NR 46, Wis. Adm. Code. It is provided to

consultants as an optional tool for groundwater contaminant trend analysis to support site closure requests under s. Comm 46.07, Comm 46.08, NR 746.07, NR 746.08, Wis. Adm. Code. Use this form or a manual method when seeking case closure under those rules. Earlier versions of this form should not be used.

Instructions: Do not change formulas or other information in cells with a blue background, only cells with a yellow background are used for data entry. To use the spreadsheet, provide at least four rounds and not more than ten rounds of data that is not seasonally affected. Use consistent units. The spreadsheet contains several error checks, and a data entry error may cause "DATA ERR" or "DATA E ERR" to be displayed. Dates that are not consecutive will show an error message and will not display the test results. The spreadsheet tests the data for both increasing and decreasing trends at both 80 percent and 90 percent confidence levels. If a declining trend is present but not at 90 percent, a site is still eligible for closure under Comm 46 and NR 746 provided that other conditions in those rules are met. If an increasing or decreasing trend is not present, an additional coefficient of variation test is used to test for stability, as proposed by Wiedemeier et al, 1999. For additional information, refer to the Interim Guidance on Natural Attenuation for Petroleum Releases, dated October 1999. Refer to the guidance for recommendations on data entry for non-detect values.
