**Re: 1st Quarter 2014 Remedial Action Progress Report
United Refining Company of Pennsylvania
Kwik Fill M-90
1322 South 2nd Street
Lawrence Township, Clearfield County, Clearfield, Pennsylvania
PADEP Facility ID #17-14821/PAUSTIF Claim #2008-0034(M)**

Dear Mr. Ferguson:

Letterle & Associates, LLC (Letterle) is pleased to submit this Remedial Action Progress Report (RAPR) for the above referenced facility. This RAPR presents the groundwater monitoring data from the first quarter of 2014 and also includes a description of remedial activities completed from January 1, 2014 through March 31, 2014 (first quarter of 2014).

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

Jed Hill
Project Manager

PADEP Facility ID #:	17-14821
PAUSTIF Claim #:	2008-0034 (M)
Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, LLC (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

This Remedial Action Progress Report (RAPR) includes a description of the on-going remedial action activities and presents the groundwater monitoring data obtained at the site during the first quarter of 2014.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two 10,000-gallon and one 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unleaded gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated unleaded gasoline constituents at concentrations above their respective Medium Specific

Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

REMEDIAL ACTION PLAN IMPLEMENTATION

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

Remedial actions completed in previous quarters include off-site well abandonment, DPE well installation, remedial system trenching and piping, remedial system installation, and the application of a chemical oxidant as part of an enhanced bioremediation feasibility study.

Remediation System

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer include:

- Two claw pumps;
- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

The recovered groundwater is treated and discharged to the sanitary sewer under an issued permit from the Clearfield Municipal Authority (CMA). Under the terms of the permit, analytical reports and totalizer readings are reported in Discharge Monitoring Reports (DMR) on a monthly basis to the CMA. Petroleum impacted soil and groundwater remediation systems have been listed as exempt from the Plan Approval/Operating permit requirements by PADEP, Division of Air Quality. The remediation system is operated under the exemption requirements.

QUARTERLY SITE ACTIVITIES COMPLETED – 1ST QUARTER 2014

Remediation System Operating Summary

Start Date:	October 30, 2012
1 st Quarter 2014 System Uptime:	98%
1 st Quarter 2014 Total Gallons Treated:	205,533 gallons
Total Gallons Treated To Date:	1,084,968 gallons

System Sampling Dates

Groundwater Influent, Midfluent, Effluent:	January 8, 2014
	February 6, 2014
	March 3, 2014

Groundwater Effluent:	January 8, 2014
	January 20, 2014
	February 6, 2014
	February 17, 2014
	March 3, 2014
	March 24, 2014
Vapor:	February 6, 2014

Groundwater Gauging/Sampling

The monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the remediation system and to monitor groundwater impacts/movement at the site. Approximately one week prior to groundwater gauging/sampling, the remediation system was deactivated to allow for static groundwater conditions.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on March 25, 2014. A total of 15 wells were gauged:

- *15 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-5, MW-7, MW-10, MW-14, MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, and MW-33.

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the first quarter of 2014 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,135.75 feet in MW-7 to 1,145.53 feet in MW-33;
- The predominant direction of movement in shallow overburden groundwater is interpreted to be to the northwest (towards the West Branch Susquehanna River); and,
- Using the March 25, 2014 groundwater elevation data, a groundwater hydraulic gradient of 0.022 feet per foot (ft/ft) between groundwater monitoring wells MW-33 and MW-7 was calculated.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the first quarter of 2014 groundwater gauging event. A groundwater potentiometric surface contour map for the March 25, 2014 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on March 25, 2014. A total of 14 wells were sampled:

- *14 wells in the shallow overburden groundwater monitoring well network: MW-2A, MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, MW-30, MW-32, and MW-33.*

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing are utilized in conjunction with a peristaltic pump. The peristaltic pump is then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing is utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well is purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater is then passed through a flow-through cell that measures dissolved oxygen (DO), pH, total dissolved solids (TDS), temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one another. Purging was considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on March 25, 2014 indicated no exceedances of the applicable PADEP Used-Aquifer TDS \leq 2,500 milligrams per liter (mg/L) Residential Statewide Health Standard (UARSHS) MSCs.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the first quarter of 2014 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

PLANNED ACTIVITY

The following activities are currently planned for the 2nd Quarter of 2014:

- Remedial system operation and maintenance (including permit-required sampling);
- Quarterly groundwater gauging and sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).
Depth-to-groundwater results are reported in feet below top-of-casing (ft-btoc).
All results reported in ug/l.
Bold values indicate levels above LRL.
Bold and shaded values Indicate exceedance of PADEP UARSHS MSCs.
NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Title

Figure 3
Groundwater Potentiometric
Surface Contour Map
March 25, 2014

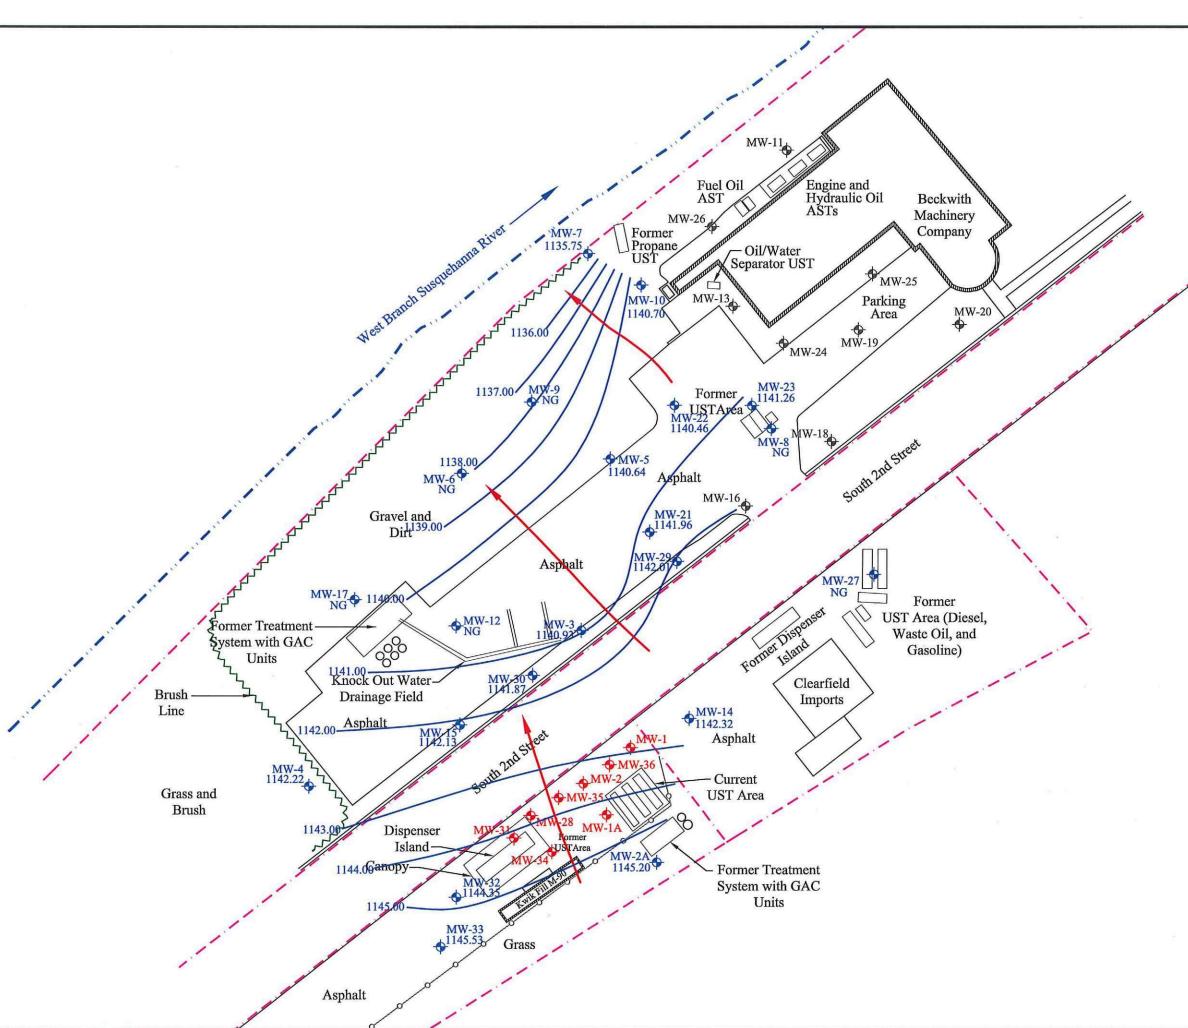

Legend:

- The legend includes the following entries:

 - Groundwater Monitoring Well Location**: Indicated by a blue diamond symbol.
 - Abandoned Groundwater Monitoring Well**: Indicated by a grey circle symbol.
 - Vapor/Groundwater Extraction Well**: Indicated by a red diamond symbol.
 - Property Boundary**: Indicated by a dashed purple line.
 - Guard Rail**: Indicated by a small square symbol.
 - Groundwater Elevation (ft)**: Indicated by a wavy blue line.
 - Groundwater Elevation Contour (dashed where inferred)**: Indicated by a dashed wavy blue line.
 - Groundwater Flow Direction**: Indicated by a red arrow pointing left.

Scale (ft.):

$1'' = 60'$
One Inch Equals Sixty Feet

Notes

- 2b The spike recovery was outside acceptance limits for the MS and/or MSD. Data accepted based on acceptable LCS recovery.
2c CCV was outside the QC range. Data accepted based on additional batch QC.

Definitions

If surrogate values are not within the indicated range, then the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

MBAS, calculated as LAS, mol wt 348

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

Samples collected by Fairway Laboratories' personnel are done so in accordance with Standard Operating Procedures established by Fairway Laboratories.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the RL are considered estimated values.

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

Dear Mr. Ferguson:

Letterle & Associates, Inc. is pleased to submit this Remedial Action Progress Report (RAPR) for the above referenced facility. This RAPR presents the groundwater monitoring data from the second quarter of 2014 and also includes a description of remedial activities completed from April 1, 2014 through June 30, 2014 (second quarter of 2014).

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

A handwritten signature in black ink, appearing to read "Jed Hill".

Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, Inc. (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

This Remedial Action Progress Report (RAPR) includes a description of the on-going remedial action activities and presents the groundwater monitoring data obtained at the site during the second quarter of 2014.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two 10,000-gallon and one 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unleaded gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated unleaded gasoline constituents at concentrations above their respective Medium Specific

Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

REMEDIAL ACTION PLAN IMPLEMENTATION

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

Remedial actions completed in previous quarters include off-site well abandonment, DPE well installation, remedial system trenching and piping, remedial system installation, and the application of a chemical oxidant as part of an enhanced bioremediation feasibility study.

Remediation System

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer include:

- Two claw pumps;
- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

The recovered groundwater is treated and discharged to the sanitary sewer under an issued permit from the Clearfield Municipal Authority (CMA). Under the terms of the permit, analytical reports and totalizer readings are reported in Discharge Monitoring Reports (DMR) on a monthly basis to the CMA. Petroleum impacted soil and groundwater remediation systems have been listed as exempt from the Plan Approval/Operating permit requirements by PADEP, Division of Air Quality. The remediation system is operated under the exemption requirements.

QUARTERLY SITE ACTIVITIES COMPLETED – 2ND QUARTER 2014

Remediation System Operating Summary

Start Date:	October 30, 2012
2 nd Quarter 2014 System Uptime:	60%
2 nd Quarter 2014 Total Gallons Treated:	125,456 gallons
Total Gallons Treated To Date:	1,210,424 gallons

System Sampling Dates

Groundwater Influent, Midfluent, Effluent:	April 7, 2014
	May 12, 2014
	June 9, 2014

Groundwater Effluent:	April 7, 2014
	April 22, 2014
	May 12, 2014
	May 27, 2014
	June 9, 2014
	June 23, 2014
Vapor:	May 12, 2014

Groundwater Gauging/Sampling

The monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the remediation system and to monitor groundwater impacts/movement at the site. Approximately one week prior to groundwater gauging/sampling, the remediation system was deactivated to allow for static groundwater conditions.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on June 11, 2014. A total of 15 wells were gauged:

- *15 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-5, MW-7, MW-10, MW-14, MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, and MW-33.

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the second quarter of 2014 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,135.21 feet in MW-7 to 1,144.97 feet in MW-2A;
- The predominant direction of movement in shallow overburden groundwater is interpreted to be to the northwest (towards the West Branch Susquehanna River); and,
- Using the June 11, 2014 groundwater elevation data, a groundwater hydraulic gradient of 0.025 feet per foot (ft/ft) between groundwater monitoring wells MW-2A and MW-7 was calculated.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the second quarter of 2014 groundwater gauging event. A groundwater potentiometric surface contour map for the June 11, 2014 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on June 11, 2014. A total of 14 wells were sampled:

- *14 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, MW-30, MW-32, and MW-33.

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing are utilized in conjunction with a peristaltic pump. The peristaltic pump is then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing is utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well is purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater is then passed through a flow-through cell that measures dissolved oxygen (DO), pH, total dissolved solids (TDS), temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one another. Purging was considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on June 11, 2014 indicated no exceedances of the applicable PADEP Used-Aquifer TDS \leq 2,500 milligrams per liter (mg/L) Residential Statewide Health Standard (UARSHS) MSCs.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the second quarter of 2014 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

PLANNED ACTIVITY

The following activities are currently planned for the 3rd Quarter of 2014:

- Remedial system operation and maintenance (including permit-required sampling);
- Quarterly groundwater gauging and sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).

Depth-to-groundwater results are reported in feet below top-of-casing (ft-btoc).

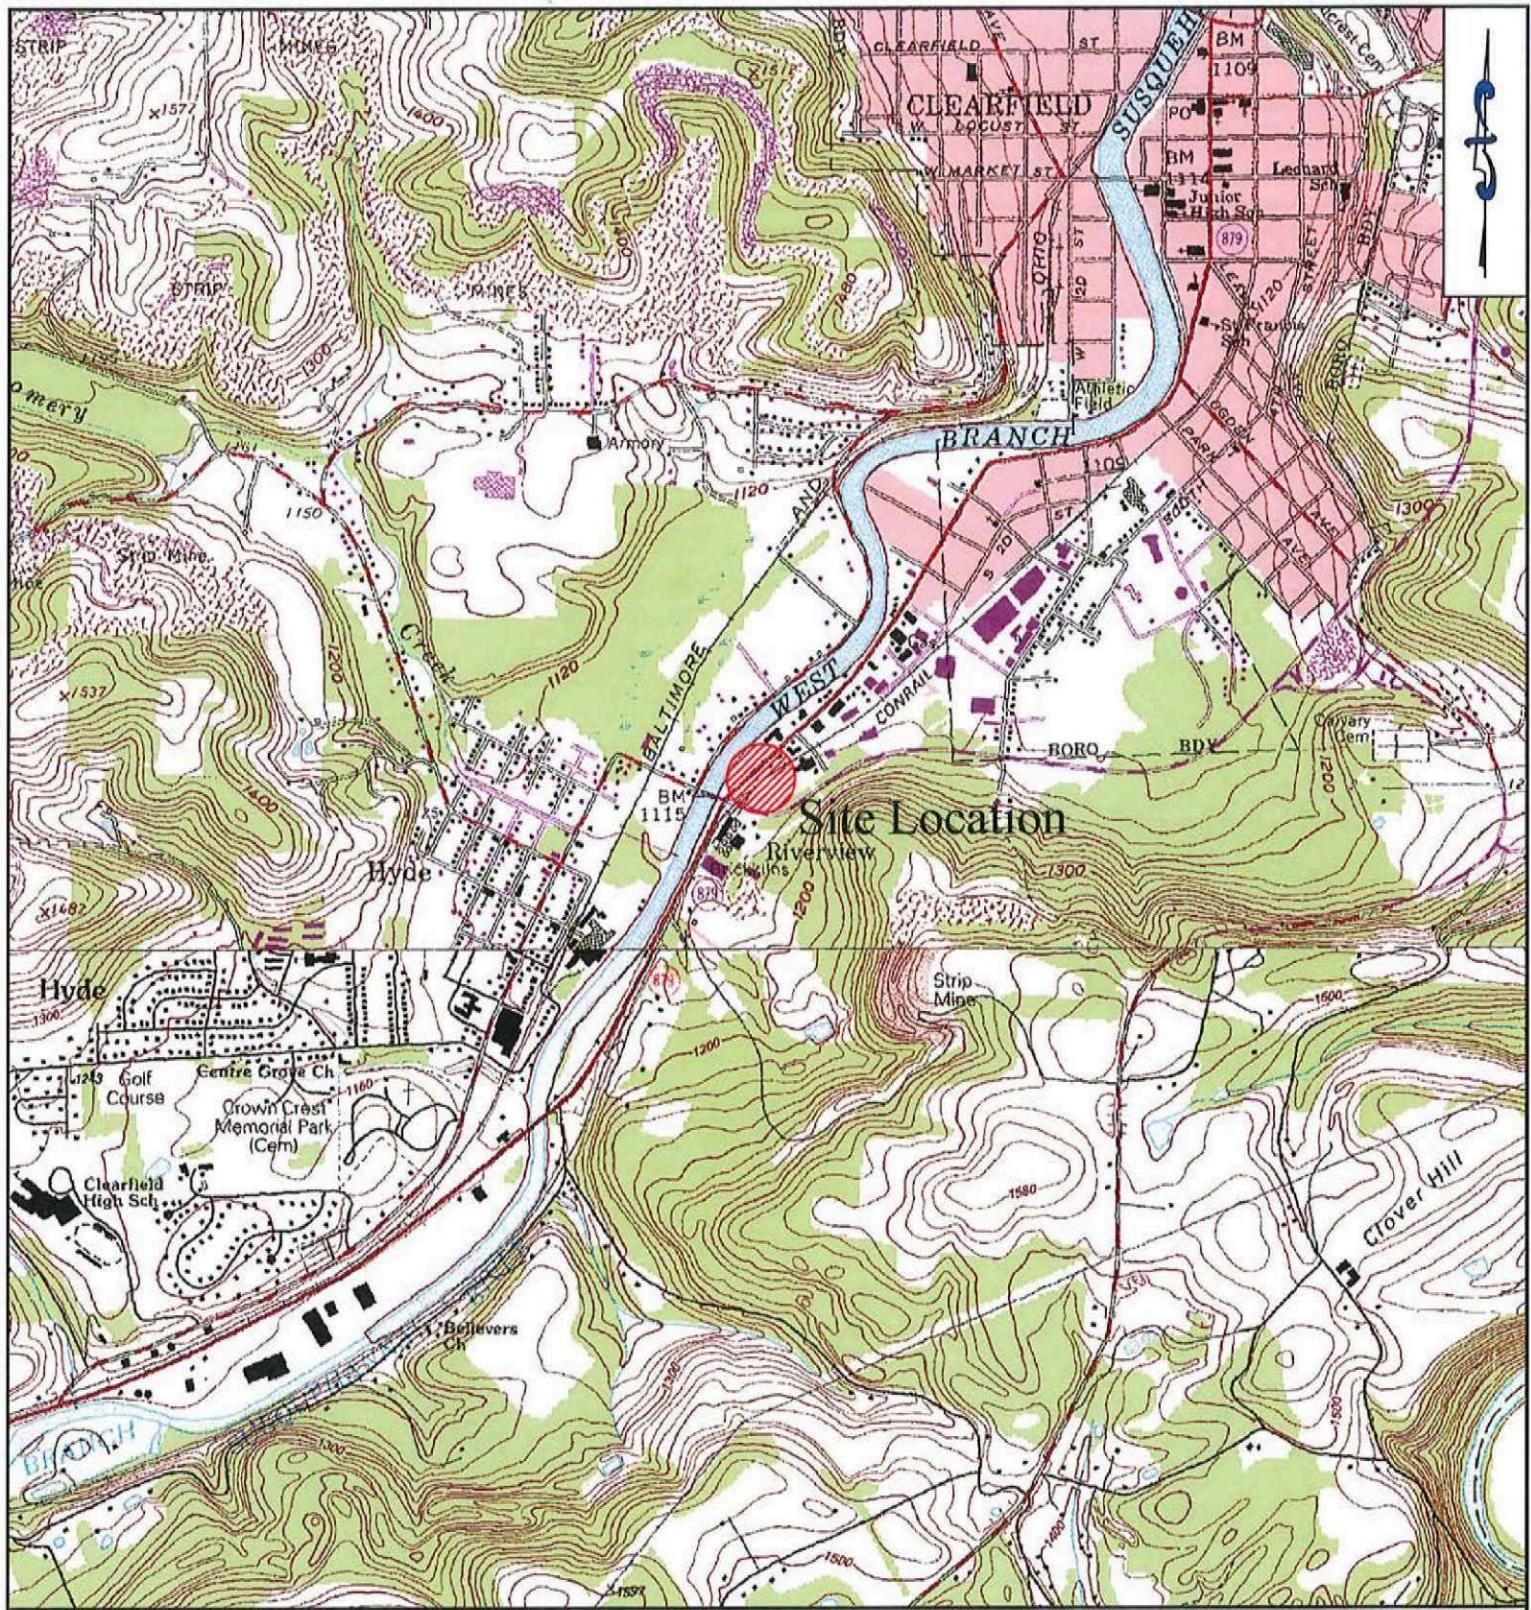

All results reported in ug/l.

Bold values indicate levels above LRL.

Bold and shaded values indicate exceedance of PADEP UARSHS MSCs.

NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Definitions

If surrogate values are not within the indicated range, then the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

MBAS, calculated as LAS, mol wt 348

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

Samples collected by Fairway Laboratories' personnel are done so in accordance with Standard Operating Procedures established by Fairway Laboratories.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the RL are considered estimated values.

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

PADEP Facility ID #17-14821/PAUSTIF Claim #2008-0034(M)**

Dear Mr. Ferguson:

Letterle & Associates, Inc. is pleased to submit this Remedial Action Progress Report (RAPR) for the above referenced facility. This RAPR presents the groundwater monitoring data from the third quarter of 2014 and also includes a description of remedial activities completed from July 1, 2014 through September 30, 2014 (third quarter of 2014).

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

Jed Hill
Project Manager

PAUSTIF Claim #:	2008-0034 (M)
Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, Inc. (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

This Remedial Action Progress Report (RAPR) includes a description of the on-going remedial action activities and presents the groundwater monitoring data obtained at the site during the third quarter of 2014.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two 10,000-gallon and one 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unladed gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated unleaded gasoline constituents at concentrations above their respective Medium Specific

Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

REMEDIAL ACTION PLAN IMPLEMENTATION

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

Remedial actions completed in previous quarters include off-site well abandonment, DPE well installation, remedial system trenching and piping, remedial system installation, and the application of a chemical oxidant as part of an enhanced bioremediation feasibility study.

Remediation System

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer include:

- Two claw pumps;
- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

The recovered groundwater is treated and discharged to the sanitary sewer under an issued permit from the Clearfield Municipal Authority (CMA). Under the terms of the permit, analytical reports and totalizer readings are reported in Discharge Monitoring Reports (DMR) on a monthly basis to the CMA. Petroleum impacted soil and groundwater remediation systems have been listed as exempt from the Plan Approval/Operating permit requirements by PADEP, Division of Air Quality. The remediation system is operated under the exemption requirements.

QUARTERLY SITE ACTIVITIES COMPLETED – 3RD QUARTER 2014

Remediation System Operating Summary

Start Date:	October 30, 2012
3 rd Quarter 2014 System Uptime:	72%
3 rd Quarter 2014 Total Gallons Treated:	145,763 gallons
Total Gallons Treated To Date:	1,356,187 gallons

System Sampling Dates

Groundwater Influent, Midfluent, Effluent:	July 7, 2014
	August 6, 2014
	September 8, 2014

Groundwater Effluent:	July 7, 2014
	July 25, 2014
	August 6, 2014
	August 18, 2014
	September 8, 2014
	September 20, 2014
Vapor:	August 6, 2014

Groundwater Gauging/Sampling

The monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the remediation system and to monitor groundwater impacts/movement at the site. Approximately one week prior to groundwater gauging/sampling, the remediation system was deactivated to allow for static groundwater conditions.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on September 24, 2014. A total of 14 wells were gauged:

- *14 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-10, MW-14, MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, and MW-33.

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the third quarter of 2014 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,133.99 feet in MW-7 to 1,144.67 feet in MW-2A;
- The predominant direction of movement in shallow overburden groundwater is interpreted to be to the northwest (towards the West Branch Susquehanna River); and,
- Using the September 24, 2014 groundwater elevation data, a groundwater hydraulic gradient of 0.028 feet per foot (ft/ft) between groundwater monitoring wells MW-2A and MW-7 was calculated.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the third quarter of 2014 groundwater gauging event. A groundwater potentiometric surface contour map for the September 24, 2014 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on September 24, 2014. A total of 12 wells were sampled:

- *12 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-10, MW-14, MW-15, MW-21, MW-29, MW-30, MW-32, and MW-33.

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing are utilized in conjunction with a peristaltic pump. The peristaltic pump is then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing is utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well is purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater is then passed through a flow-through cell that measures dissolved oxygen (DO), pH, total dissolved solids (TDS), temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one another. Purging was considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on September 24, 2014 indicated no exceedances of the applicable PADEP Used-Aquifer TDS \leq 2,500 milligrams per liter (mg/L) Residential Statewide Health Standard (UARSHS) MSCs.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the third quarter of 2014 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

PLANNED ACTIVITY

The following activities are currently planned for the 4th Quarter of 2014:

- Shut down the remediation system (per the PAUSTIF bid schedule)
- Soil attainment and soil vapor attainment sampling;
- Quarterly groundwater gauging and attainment sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).
Depth-to-groundwater results are reported in feet below top-of-casing (ft-btoc).
All results reported in ug/l.
Bold values indicate levels above LRL.
Bold and shaded values indicate exceedance of PADEP UARSHS MSCs.
NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Definitions

If surrogate values are not within the indicated range, then the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

MBAS, calculated as LAS, mol wt 348

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

Samples collected by Fairway Laboratories' personnel are done so in accordance with Standard Operating Procedures established by Fairway Laboratories.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the RL are considered estimated values.

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

Terms & Conditions

Services provided by Fairway Laboratories Inc. are limited to the terms and conditions stated herein, unless otherwise agreed to in a formal contract.

CHAIN OF CUSTODY Fairway Laboratories Inc. ("Fairway," "us" or "we") will initiate a chain-of-custody/request for analysis upon sample receipt unless the client includes a completed form with the received sample(s). Upon request, Fairway will provide chain-of-custody forms for use.

CONFIDENTIALITY Fairway maintains confidentiality in all of our client interactions. The client's consent will be required before releasing information about the services provided.

CONTRACTS All contracts are subject to review and approval by Fairway's legal council. Each contract must be signed by a corporate officer.

PAYMENT/BILLING Unless otherwise set forth in a signed contract or purchase order, terms of payment are "NET 30 Days." The time allowed for payment shall begin based on the invoice date. A 1.5% per month service charge may be added to all unpaid balances beyond the initial 30 days. In its sole discretion, Fairway reserves the right to request payment before services and hold sample results for payment of due balances. We will not bill a third party without prior agreement among all parties acknowledging and accepting responsibility for payment.

SAMPLE COLLECTION AND SUBMISSION Clients not requesting collection services from Fairway are responsible for proper collection, preservation, packaging, and delivery of samples to the laboratory in accordance with current law and commercial practice. Fairway shall have no responsibility for sample integrity prior to the receipt of the sample(s) and/or for any inaccuracy in test or analyses results as a result of the failure of the client or any third party to maintain the integrity of samples prior to delivery to Fairway. All samples submitted must be accompanied by a completed chain of custody or similar document clearly noting the requested analyses, date/time sampled, client contact information, and trail of custody.

SUBCONTRACTING Some analyses may require subcontracting to another laboratory. Unless the client indicates otherwise, this decision will be made by Fairway. Subcontracted work will be identified on the final report in accordance with NELAC requirements.

RETURN OF RESULTS Fairway routinely provides faxed or verbal results within 10 working days of receipt of sample(s) and a hard copy of the data results is routinely received via US Postal Service within 15 working days. At the request of the client, Fairway may offer expedited return of sample results. Surcharges may apply to rush requests. All rush requests must be pre-approved by Fairway. We reserve the right to charge an archive retrieval fee for results older than one (1) year from the date of the request. All records will be maintained by Fairway for 5 years, after which, they will be destroyed.

SAMPLE DISPOSAL Fairway will maintain samples for four (4) weeks after the sample receipt date. Fairway will dispose of samples which are not and/or do not contain hazardous wastes (as such term is defined by applicable federal or state law), unless prior arrangements have been made for long-term storage. Fairway reserves the right to charge a disposal fee for the proper disposal of samples found or suspected to contain hazardous waste. A return shipping charge will be invoiced for samples returned to the client at their request.

HAZARD COMMUNICATION The client has the responsibility to inform the laboratory of any hazardous characteristics known or suspected about the sample, and to provide information on hazard prevention and personal protection as necessary or otherwise required by applicable law.

WARRANTY AND LIMITATION OF LIABILITY For services rendered, Fairway warrants that it will apply its best scientific knowledge and judgment and to employ its best level of effort consistent with professional standards within the environmental testing industry in performing the analytical services requested by its clients. We disclaim any other warranties, expressed or implied by law. Fairway does not accept any legal responsibility for the purposes for which client uses the test results.

LITIGATION All costs associated with compliance to any subpoena for documents, for testimony in a court of law, or for any other purpose relating to work performed by Fairway Laboratories, Inc. shall be invoiced by Fairway and paid by client. These costs shall include, but are not limited to, hourly charges for the persons involved, travel, mileage, and accommodations and for any and all other expenses associated with said litigation.

Fairway Laboratories, Inc.

Fairway Labs in Altoona, PA is a NELAP (National Environmental Laboratory Accreditation Program) accredited lab, and as such, certifies that all applicable test results meet the requirements of NELAP, unless otherwise stated on the analytical report.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Dear Mr. Ferguson:

Letterle & Associates, Inc. is pleased to submit this Remedial Action Progress Report (RAPR) for the above-referenced facility. This RAPR presents the groundwater monitoring data/results from the fourth quarter of 2014 and represents the first completed quarter of groundwater attainment sampling at the site.

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

Jed Hill
Project Manager

PADEP Facility ID #:	17-14821
PAUSTIF Claim #:	2008-0034 (M)
Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 former remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, Inc. (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

The purpose of this Remedial Action Progress Report (RAPR) is to present the groundwater monitoring data/results collected during the fourth quarter of 2014. Additionally, this RAPR represents the first completed quarter of groundwater attainment sampling at the site.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two 10,000-gallon and one 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unleaded gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated

unleaded gasoline constituents at concentrations above their respective Medium Specific Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

REMEDIAL ACTION ACTIVITIES

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer included:

- Two claw pumps;

- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

In compliance with the PAUSTIF remediation agreement, the remediation system was to be operated for a total period of two years. Additionally, as specified in the remediation agreement, applicable PADEP Used-Aquifer (total dissolved solids (TDS) \leq 2,500 milligrams per liter (mg/L)) Residential Statewide Health Standard (UARSHS) MSCs in groundwater had to be attained within seven quarters of system operation. This criterion was met and the remediation system was shut down on October 10, 2014 and the groundwater attainment monitoring program was initiated in the fourth quarter of 2014.

Approximately 1,356,187 gallons of groundwater was recovered (via the DPE system) and discharged to the Clearfield Municipal Authority (CMA) (via discharge permit) during the 24 months of operation.

QUARTERLY SITE ACTIVITIES COMPLETED – 4TH QUARTER 2014

Groundwater Gauging/Sampling

The groundwater monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the completed remediation activities and to monitor groundwater impacts/movement at the site.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on December 17, 2014. A total of 22 wells were gauged:

- *22 wells in the shallow overburden groundwater monitoring well network: MW-1, MW-1A, MW-2, MW-2A, MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-28, MW-29, MW-30, MW-31, MW-32, MW-33, MW-34, MW-35, and MW-36.*

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were

recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the fourth quarter of 2014 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,135.99 feet in MW-7 to 1,147.07 feet in MW-2A;
- The predominant direction of groundwater movement in the shallow overburden aquifer is interpreted to be to the northwest (towards the West Branch Susquehanna River); and,
- Using the December 17, 2014 groundwater elevation data, a groundwater hydraulic gradient of 0.029 feet per foot (ft/ft) between groundwater monitoring wells MW-2A and MW-7 was calculated.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the fourth quarter of 2014 groundwater gauging event. A groundwater potentiometric surface contour map for the December 17, 2014 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on December 17, 2014. A total of 19 wells were sampled:

- *19 wells in the shallow overburden groundwater monitoring well network:* MW-1, MW-1A, MW-2, MW-2A, MW-3, MW-4, MW-7, MW-10, MW-14, MW-15, MW-21, MW-28, MW-29, MW-30, MW-31, MW-32, MW-34, MW-35, and MW-36.

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing were utilized in conjunction with a peristaltic pump. The peristaltic pump was then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing was utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well was purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater was then passed through a flow-through cell that measures dissolved oxygen (DO), pH, TDS, temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one another. Purging was

considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on December 17, 2014 indicated no exceedances of the applicable PADEP UARSHS MSCs.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the fourth quarter of 2014 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

CONCLUSIONS AND RECOMMENDATIONS

In compliance with the PAUSTIF remediation agreement, the remediation system operated for a total period of two years and was shut down on October 10, 2014. The groundwater attainment monitoring program was initiated in the fourth quarter of 2014. Additionally, the initial soil vapor attainment sampling event and the soil attainment sampling event were completed in the fourth quarter of 2014.

Quarterly groundwater attainment sampling was performed on December 17, 2014 (fourth quarter of 2014), which represents the first of eight required groundwater attainment sampling events to be performed at the site as part of the groundwater attainment monitoring program.

PLANNED ACTIVITY

The following activities are currently planned for the 1st Quarter of 2015:

- Quarterly groundwater gauging and attainment sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).

Depth-to-groundwater results are reported in feet below top-of-casing (ft-btoc).

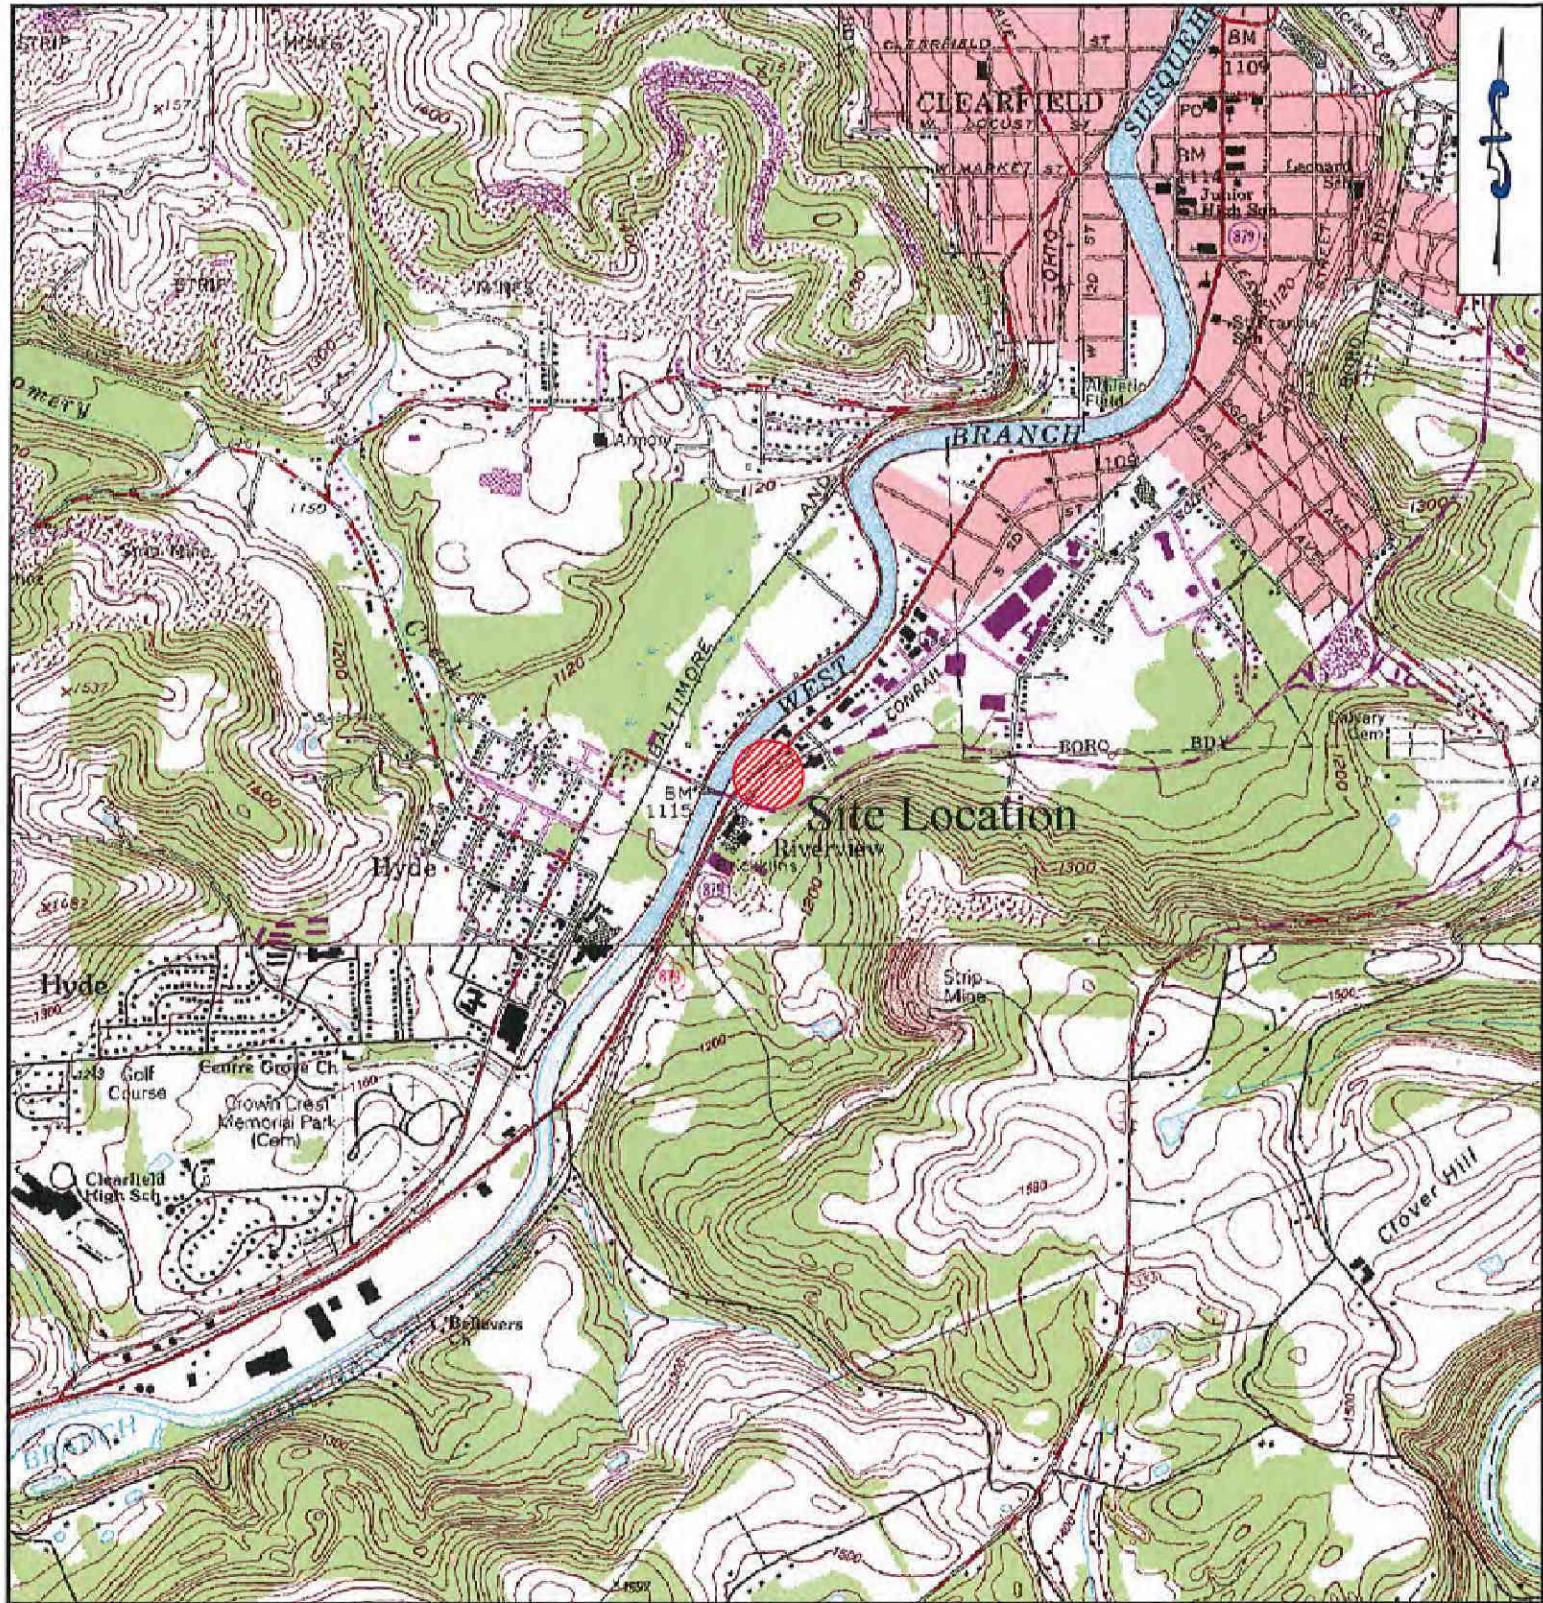

All results reported in ug/l.

Bold values indicate levels above LRL.

Bold and shaded values indicate exceedance of PADEP UARSHS MSCs.

NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Notes

- 2b The spike recovery was outside acceptance limits for the MS and/or MSD. Data accepted based on acceptable LCS recovery.
2e CCV was outside the QC range. Data accepted based on additional batch QC.

Definitions

If surrogate values are not within the indicated range, then the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

MBAS, calculated as LAS, mol wt 348

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

Samples collected by Fairway Laboratories' personnel are done so in accordance with Standard Operating Procedures established by Fairway Laboratories.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the RL are considered estimated values.

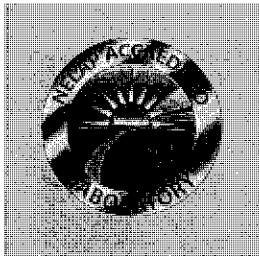

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

Fairway Laboratories, Inc.

Fairway Labs in Altoona, PA is a NELAP (National Environmental Laboratory Accreditation Program) accredited lab, and as such, certifies that all applicable test results meet the requirements of NELAP, unless otherwise stated on the analytical report.

Terms & Conditions

Services provided by Fairway Laboratories Inc. are limited to the terms and conditions stated herein, unless otherwise agreed to in a formal contract.

CHAIN OF CUSTODY Fairway Laboratories Inc. ("Fairway," "us" or "we") will initiate a chain-of-custody/request for analysis upon sample receipt unless the client includes a completed form with the received sample(s). Upon request, Fairway will provide chain-of-custody forms for use.

CONFIDENTIALITY Fairway maintains confidentiality in all of our client interactions. The client's consent will be required before releasing information about the services provided.

CONTRACTS All contracts are subject to review and approval by Fairway's legal council. Each contract must be signed by a corporate officer.

PAYMENT/BILLING Unless otherwise set forth in a signed contract or purchase order, terms of payment are "NET 30 Days." The time allowed for payment shall begin based on the invoice date. A 1.5% per month service charge may be added to all unpaid balances beyond the initial 30 days. In its sole discretion, Fairway reserves the right to request payment before services and hold sample results for payment of due balances. We will not bill a third party without prior agreement among all parties acknowledging and accepting responsibility for payment.

SAMPLE COLLECTION AND SUBMISSION Clients not requesting collection services from Fairway are responsible for proper collection, preservation, packaging, and delivery of samples to the laboratory in accordance with current law and commercial practice. Fairway shall have no responsibility for sample integrity prior to the receipt of the sample(s) and/or for any inaccuracy in test or analyses results as a result of the failure of the client or any third party to maintain the integrity of samples prior to delivery to Fairway. All samples submitted must be accompanied by a completed chain of custody or similar document clearly noting the requested analyses, dates/time sampled, client contact information, and trail of custody.

SUBCONTRACTING Some analyses may require subcontracting to another laboratory. Unless the client indicates otherwise, this decision will be made by Fairway. Subcontracted work will be identified on the final report in accordance with NELAC requirements.

RETURN OF RESULTS Fairway routinely provides faxed or verbal results within 10 working days of receipt of sample(s) and a hard copy of the data results is routinely received via US Postal Service within 15 working days. At the request of the client, Fairway may offer expedited return of sample results. Surcharges may apply to rush requests. All rush requests must be pre-approved by Fairway. We reserve the right to charge an archive retrieval fee for results older than one (1) year from the date of the request. All records will be maintained by Fairway for 5 years, after which, they will be destroyed.

SAMPLE DISPOSAL Fairway will maintain samples for four (4) weeks after the sample receipt date. Fairway will dispose of samples which are not and/or do not contain hazardous wastes (as such term is defined by applicable federal or state law), unless prior arrangements have been made for long-term storage. Fairway reserves the right to charge a disposal fee for the proper disposal of samples found or suspected to contain hazardous waste. A return shipping charge will be invoiced for samples returned to the client at their request.

HAZARD COMMUNICATION The client has the responsibility to inform the laboratory of any hazardous characteristics known or suspected about the sample, and to provide information on hazard prevention and personal protection as necessary or otherwise required by applicable law.

WARRANTY AND LIMITATION OF LIABILITY For services rendered, Fairway warrants that it will apply its best scientific knowledge and judgment and to employ its best level of effort consistent with professional standards within the environmental testing industry in performing the analytical services requested by its clients. We disclaim any other warranties, expressed or implied by law. Fairway does not accept any legal responsibility for the purposes for which client uses the test results.

LITIGATION All costs associated with compliance to any subpoena for documents, for testimony in a court of law, or for any other purpose relating to work performed by Fairway Laboratories, Inc. shall be invoiced by Fairway and paid by client. These costs shall include, but are not limited to, hourly charges for the persons involved, travel, mileage, and accommodations and for any and all other expenses associated with said litigation.

Fairway Laboratories, Inc.

Fairway Labs in Altoona, PA is a NELAP (National Environmental Laboratory Accreditation Program) accredited lab, and as such, certifies that all applicable test results meet the requirements of NELAP, unless otherwise stated on the analytical report.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
