Re: 1st Quarter 2013 Remedial Action Progress Report
United Refining Company of Pennsylvania
Kwik Fill M-90
1322 South 2nd Street
Lawrence Township, Clearfield County, Clearfield, Pennsylvania
PADEP Facility ID #17-14821/PAUSTIF Claim #2008-0034(M)

Dear Mr. Ferguson:

Letterle & Associates, LLC (Letterle) is pleased to submit this Remedial Action Progress Report (RAPR) for the above referenced facility. This RAPR presents the groundwater monitoring data from the first quarter of 2013 and also includes a description of remedial activities completed from January 1, 2013 through March 31, 2013 (first quarter of 2013).

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

Jed Hill
Project Manager

PADEP Facility ID #:	17-14821
PAUSTIF Claim #:	2008-0034 (M)
Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, LLC (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

This Remedial Action Progress Report (RAPR) includes a description of the on-going remedial action activities and presents the groundwater monitoring data obtained at the site during the first quarter of 2013.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two, 10,000-gallon and one, 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unleaded gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated unleaded gasoline constituents at concentrations above their respective Medium Specific

Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

REMEDIAL ACTION PLAN IMPLEMENTATION

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

Remedial actions completed in previous quarters include off-site well abandonment, DPE well installation, remedial system trenching and piping, remedial system installation, and the application of a chemical oxidant as part of an enhanced bioremediation feasibility study.

Remediation System

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer include:

- Two claw pumps;
- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

The recovered groundwater is treated and discharged to the sanitary sewer under an issued permit from the Clearfield Municipal Authority (CMA). Under the terms of the permit, analytical reports and totalizer readings are reported in Discharge Monitoring Reports (DMR) on a monthly basis to the CMA. Petroleum impacted soil and groundwater remediation systems have been listed as exempt from the Plan Approval/Operating permit requirements by PADEP, Division of Air Quality. The remediation system is operated under the exemption requirements.

QUARTERLY SITE ACTIVITIES COMPLETED – 1ST QUARTER 2013

Remediation System Operating Summary

Start Date:	October 30, 2012
1 st Quarter 2013 System Uptime:	99%
1 st Quarter 2013 Total Gallons Treated:	231,477 gallons
Total Gallons Treated To Date:	453,986 gallons

System Sampling Dates

Groundwater Influent, Midfluent, Effluent:	January 23, 2013
	February 7, 2013
	March 4, 2013

Groundwater Effluent:	January 7, 2013
	January 23, 2013
	February 7, 2013
	February 19, 2013
	March 4, 2013
	March 21, 2013

Vapor: None

Groundwater Gauging/Sampling

The monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the remediation system and to monitor groundwater impacts/movement at the site. Approximately one week prior to groundwater gauging/sampling, the remediation system was deactivated to allow for static groundwater conditions.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on March 5, 2013. A total of 14 wells were gauged:

- *14 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-10, MW-14, MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, and MW-33.

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the first quarter of 2013 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,135.46 feet in MW-7 to 1,145.67 feet in MW-33;
- The predominant direction of movement in shallow overburden groundwater is interpreted to be to the north (towards the West Branch Susquehanna River);
- Using the March 5, 2013 groundwater elevation data, a groundwater hydraulic gradient of 0.023 feet per foot (ft/ft) between groundwater monitoring wells MW-33 and MW-7 was calculated; and,

- The groundwater elevations observed in MW-10 was considered anomalous and was not used in groundwater contouring.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the first quarter of 2013 groundwater gauging event. A groundwater potentiometric surface contour map for the March 5, 2013 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on March 5, 2013. A total of 14 wells were sampled:

- *14 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, MW-30, MW-32, and MW-33.

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing are utilized in conjunction with a peristaltic pump. The peristaltic pump is then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing is utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well is purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater is then passed through a flow-through cell that measures dissolved oxygen (DO), pH, total dissolved solids (TDS), temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one and other. Purging was considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via

United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on March 5, 2013 indicated the following exceedances of the applicable PADEP Used-Aquifer TDS \leq 2,500 milligrams per liter (mg/L)) Residential Statewide Health Standard (UARSHS) MSCs:

- Benzene in well MW-3.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the first quarter of 2013 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

A benzene isoconcentration contour map for the March 5, 2013 (first quarter of 2013) groundwater sampling event is presented as **Figure 4**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

PLANNED ACTIVITY

The following activities are currently planned for the 2nd Quarter of 2013:

- Remedial system operation and maintenance (including permit-required sampling);
- Quarterly groundwater gauging and sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).

Depth-to-groundwater results are reported in feet below top-of-casing (ft-bloc).

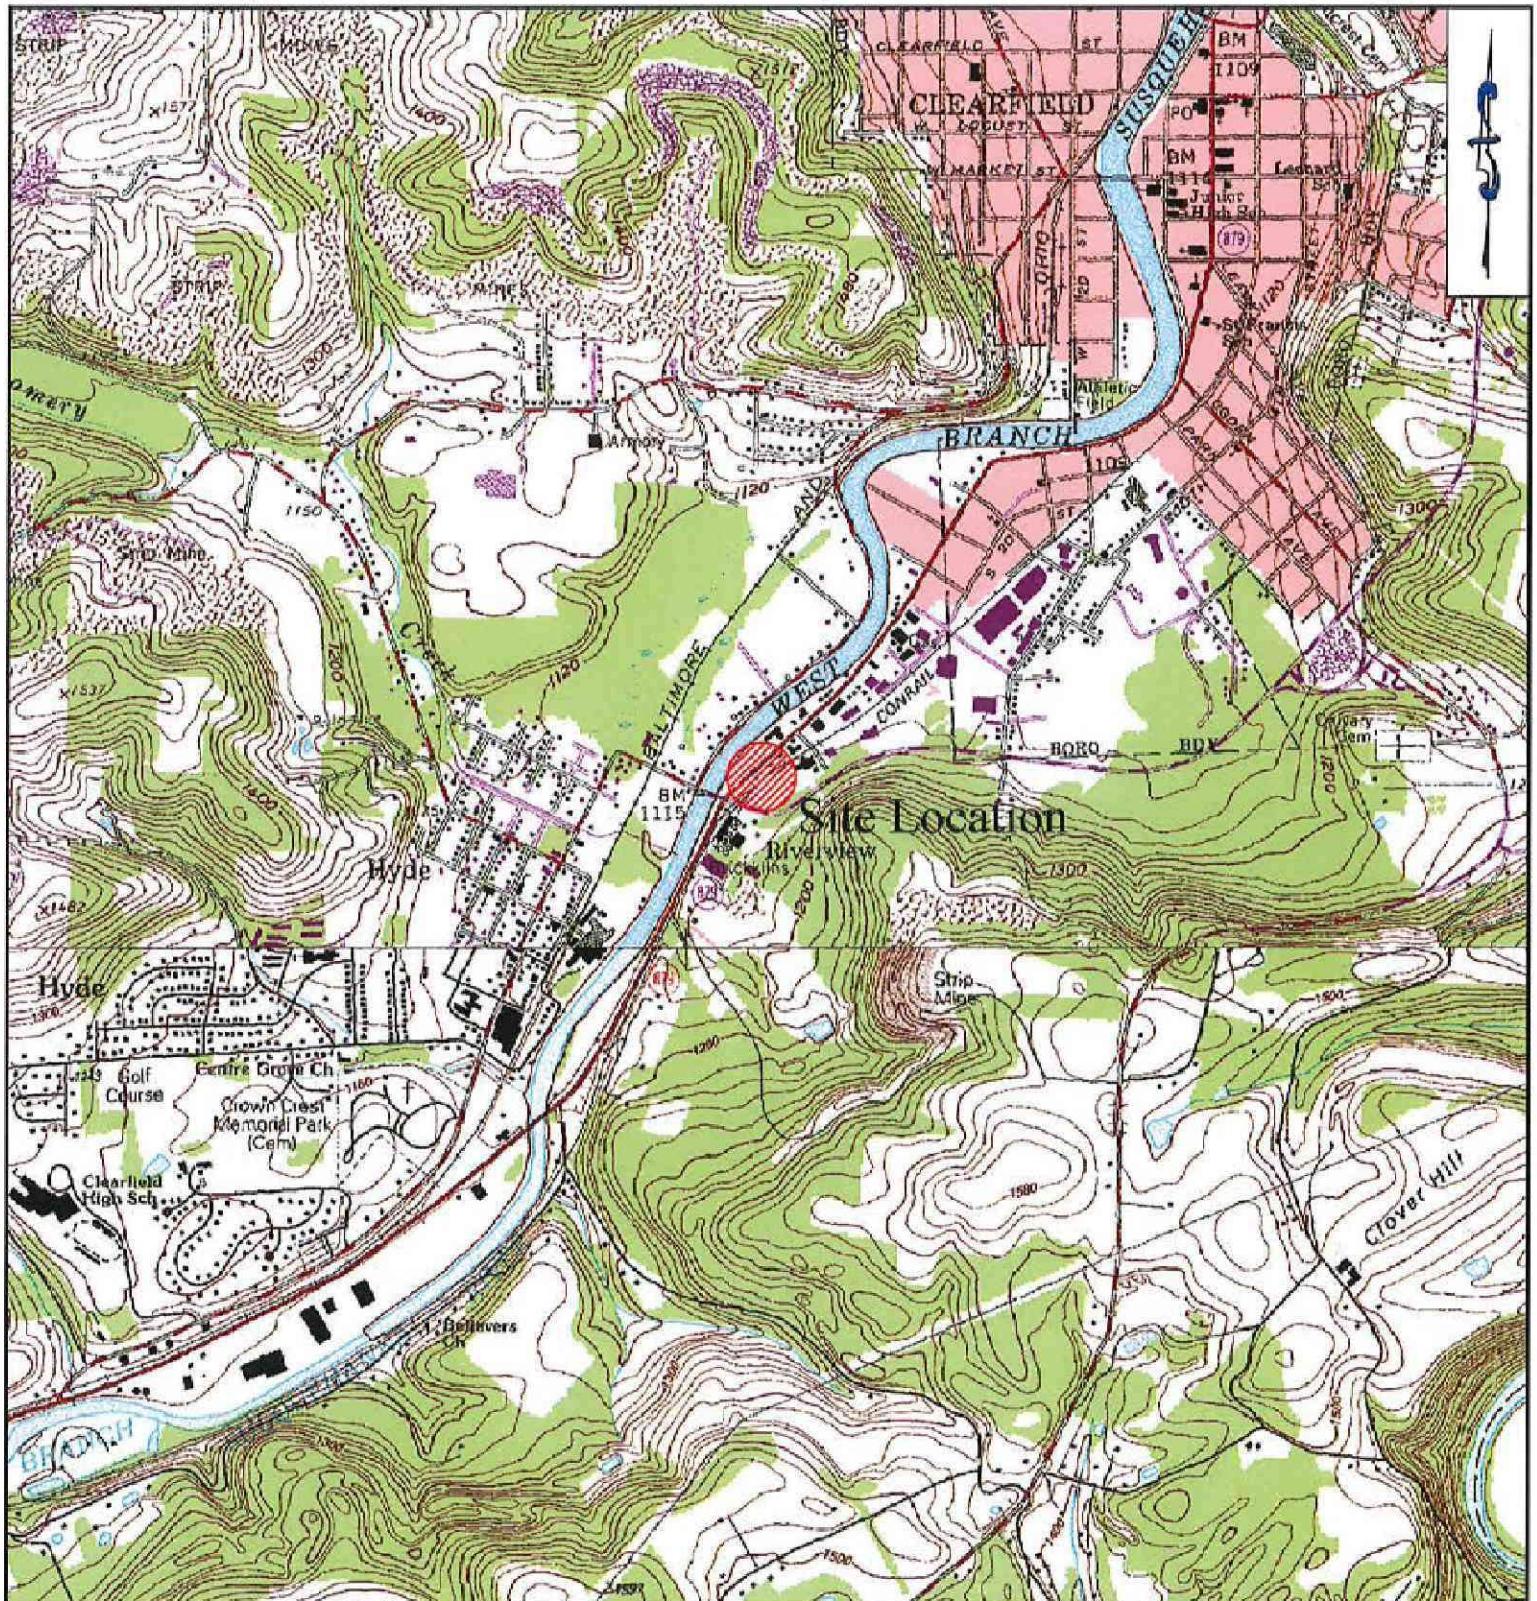

All results reported in ug/l.

Bold values indicate levels above LRL.

Bold and shaded values indicate exceedance of PADEP UARSHS MSCs.

NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Notes

QB The spike recovery was outside acceptance limits for the MS and/or MSD due to sample matrix interferences. The batch was accepted based on acceptable CCV recovery.

Definitions

Surrogate values must be within the indicated range, otherwise the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the MDL are considered estimated values.

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

Fairway Laboratories, Inc.

Fairway Labs in Altoona, PA is a NELAP (National Environmental Laboratory Accreditation Program) accredited lab, and as such, certifies that all applicable test results meet the requirements of NELAP, unless otherwise stated on the analytical report.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Dear Mr. Ferguson:

Letterle & Associates, LLC (Letterle) is pleased to submit this Remedial Action Progress Report (RAPR) for the above referenced facility. This RAPR presents the groundwater monitoring data from the second quarter of 2013 and also includes a description of remedial activities completed from April 1, 2013 through June 30, 2013 (second quarter of 2013).

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

Jed Hill
Project Manager

Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, LLC (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

This Remedial Action Progress Report (RAPR) includes a description of the on-going remedial action activities and presents the groundwater monitoring data obtained at the site during the second quarter of 2013.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two, 10,000-gallon and one, 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unleaded gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated unleaded gasoline constituents at concentrations above their respective Medium Specific

Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

REMEDIAL ACTION PLAN IMPLEMENTATION

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

Remedial actions completed in previous quarters include off-site well abandonment, DPE well installation, remedial system trenching and piping, remedial system installation, and the application of a chemical oxidant as part of an enhanced bioremediation feasibility study.

Remediation System

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer include:

- Two claw pumps;
- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

The recovered groundwater is treated and discharged to the sanitary sewer under an issued permit from the Clearfield Municipal Authority (CMA). Under the terms of the permit, analytical reports and totalizer readings are reported in Discharge Monitoring Reports (DMR) on a monthly basis to the CMA. Petroleum impacted soil and groundwater remediation systems have been listed as exempt from the Plan Approval/Operating permit requirements by PADEP, Division of Air Quality. The remediation system is operated under the exemption requirements.

QUARTERLY SITE ACTIVITIES COMPLETED – 2ND QUARTER 2013

Remediation System Operating Summary

Start Date:	October 30, 2012
2 nd Quarter 2013 System Uptime:	52%
2 nd Quarter 2013 Total Gallons Treated:	127,525 gallons
Total Gallons Treated To Date:	581,511 gallons

System Sampling Dates

Groundwater Influent, Midfluent, Effluent:	April 10, 2013
	May 14, 2013
	June 7, 2013

Groundwater Effluent:	April 10, 2013
	April 30, 2013
	May 14, 2013
	May 29, 2013
	June 7, 2013
	June 19, 2013
Vapor:	June 7, 2013

Groundwater Gauging/Sampling

The monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the remediation system and to monitor groundwater impacts/movement at the site. Approximately one week prior to groundwater gauging/sampling, the remediation system was deactivated to allow for static groundwater conditions.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on May 28, 2013. A total of 15 wells were gauged:

- *15 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-5, MW-7, MW-10, MW-14, MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, and MW-33.

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the second quarter of 2013 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,135.71 feet in MW-7 to 1,145.98 feet in MW-33;
- The predominant direction of movement in shallow overburden groundwater is interpreted to be to the north (towards the West Branch Susquehanna River);
- Using the May 28, 2013 groundwater elevation data, a groundwater hydraulic gradient of 0.023 feet per foot (ft/ft) between groundwater monitoring wells MW-33 and MW-7 was calculated; and,

- The groundwater elevations observed in MW-10 was considered anomalous and was not used in groundwater contouring.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the second quarter of 2013 groundwater gauging event. A groundwater potentiometric surface contour map for the May 28, 2013 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on May 28, 2013. A total of 14 wells were sampled:

- *14 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, MW-30, MW-32, and MW-33.

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing are utilized in conjunction with a peristaltic pump. The peristaltic pump is then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing is utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well is purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater is then passed through a flow-through cell that measures dissolved oxygen (DO), pH, total dissolved solids (TDS), temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one another. Purging was considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via

United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on May 28, 2013 indicated no exceedances of the applicable PADEP Used-Aquifer TDS \leq 2,500 milligrams per liter (mg/L) Residential Statewide Health Standard (UARSHS) MSCs.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the second quarter of 2013 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

PLANNED ACTIVITY

The following activities are currently planned for the 3rd Quarter of 2013:

- Remedial system operation and maintenance (including permit-required sampling);
- Quarterly groundwater gauging and sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).

Depth-to-groundwater results are reported in feet below top-of-casing (ft-btoc).

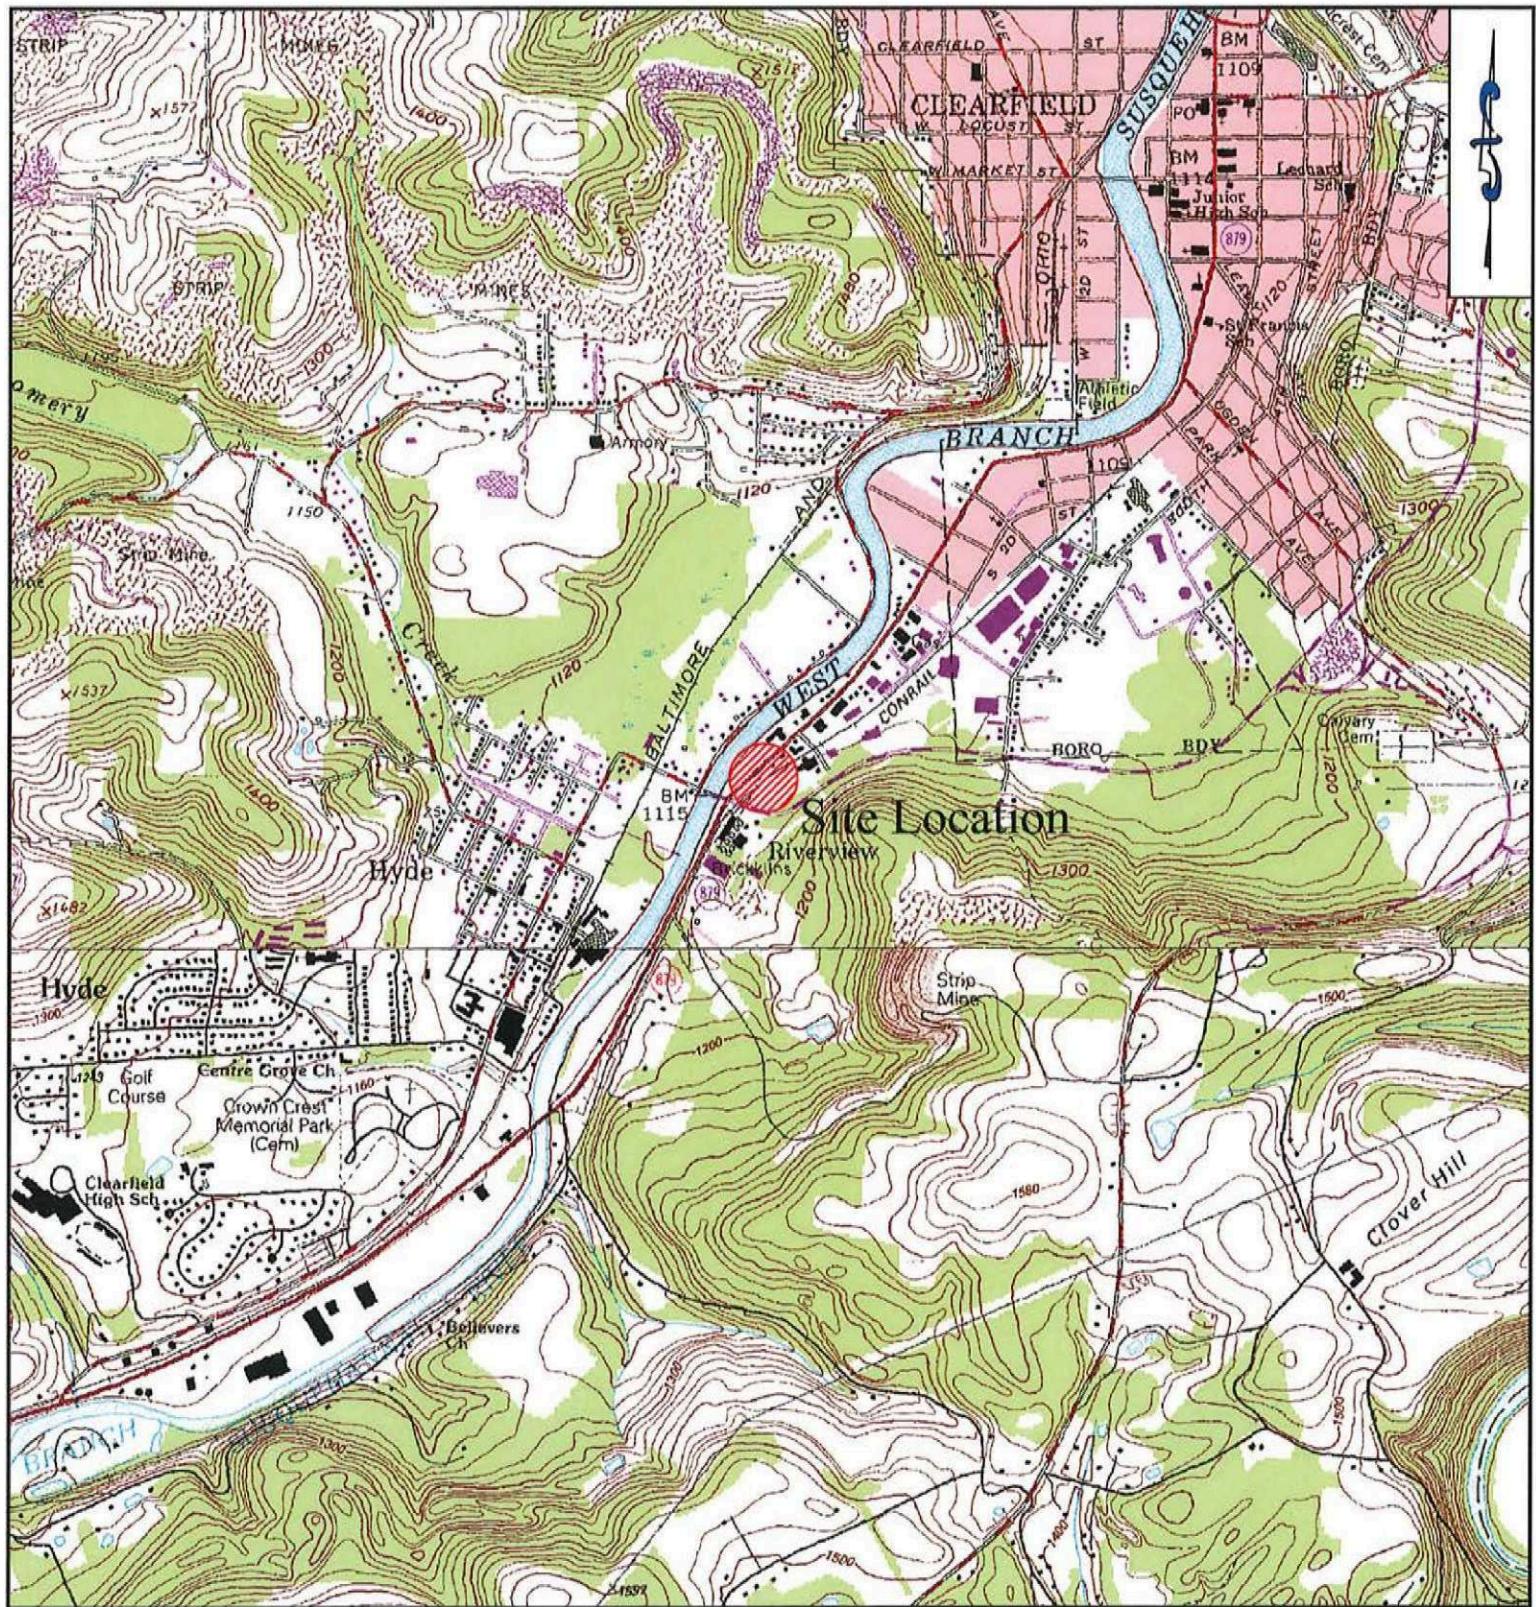

All results reported in ug/l.

Bold values indicate levels above LRL.

Bold and shaded values indicate exceedance of PADEP UARSHS MSCs.

NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Notes

- QA The RPD result exceeded the QC control limits for the duplicate sample analyzed.
VC Check standard was outside the QC range. Data accepted based on acceptable LCS.

Definitions

Surrogate values must be within the indicated range, otherwise the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the MDL are considered estimated values.

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

Fairway Laboratories, Inc.

Fairway Labs in Altoona, PA is a NELAP (National Environmental Laboratory Accreditation Program) accredited lab, and as such, certifies that all applicable test results meet the requirements of NELAP, unless otherwise stated on the analytical report.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Dear Mr. Ferguson:

Letterle & Associates, LLC (Letterle) is pleased to submit this Remedial Action Progress Report (RAPR) for the above referenced facility. This RAPR presents the groundwater monitoring data from the third quarter of 2013 and also includes a description of remedial activities completed from July 1, 2013 through September 30, 2013 (third quarter of 2013).

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

Jed Hill
Project Manager

Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, LLC (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

This Remedial Action Progress Report (RAPR) includes a description of the on-going remedial action activities and presents the groundwater monitoring data obtained at the site during the third quarter of 2013.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two, 10,000-gallon and one, 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unleaded gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated unleaded gasoline constituents at concentrations above their respective Medium Specific

Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

REMEDIAL ACTION PLAN IMPLEMENTATION

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

Remedial actions completed in previous quarters include off-site well abandonment, DPE well installation, remedial system trenching and piping, remedial system installation, and the application of a chemical oxidant as part of an enhanced bioremediation feasibility study.

Remediation System

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer include:

- Two claw pumps;
- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

The recovered groundwater is treated and discharged to the sanitary sewer under an issued permit from the Clearfield Municipal Authority (CMA). Under the terms of the permit, analytical reports and totalizer readings are reported in Discharge Monitoring Reports (DMR) on a monthly basis to the CMA. Petroleum impacted soil and groundwater remediation systems have been listed as exempt from the Plan Approval/Operating permit requirements by PADEP, Division of Air Quality. The remediation system is operated under the exemption requirements.

QUARTERLY SITE ACTIVITIES COMPLETED – 3RD QUARTER 2013

Remediation System Operating Summary

Start Date:	October 30, 2012
3 rd Quarter 2013 System Uptime:	62%
3 rd Quarter 2013 Total Gallons Treated:	102,725 gallons
Total Gallons Treated To Date:	684,236 gallons

System Sampling Dates

Groundwater Influent, Midfluent, Effluent:	July 11, 2013
	August 5, 2013
	September 3, 2013

Groundwater Effluent:	July 11, 2013
	July 23, 2013
	August 5, 2013
	August 20, 2013
	September 3, 2013
	September 18, 2013
Vapor:	September 3, 2013

Groundwater Gauging/Sampling

The monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the remediation system and to monitor groundwater impacts/movement at the site. Approximately one week prior to groundwater gauging/sampling, the remediation system was deactivated to allow for static groundwater conditions.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on September 9, 2013. A total of 15 wells were gauged:

- *15 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-5, MW-7, MW-10, MW-14, MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, and MW-33.

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the third quarter of 2013 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,134.21 feet in MW-7 to 1,144.81 feet in MW-2A;
- The predominant direction of movement in shallow overburden groundwater is interpreted to be to the northwest (towards the West Branch Susquehanna River); and,
- Using the September 9, 2013 groundwater elevation data, a groundwater hydraulic gradient of 0.028 feet per foot (ft/ft) between groundwater monitoring wells MW-2A and MW-7 was calculated.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the third quarter of 2013 groundwater gauging event. A groundwater potentiometric surface contour map for the September 9, 2013 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on September 9, 2013. A total of 14 wells were sampled:

- *14 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, MW-30, MW-32, and MW-33.

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing are utilized in conjunction with a peristaltic pump. The peristaltic pump is then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing is utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well is purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater is then passed through a flow-through cell that measures dissolved oxygen (DO), pH, total dissolved solids (TDS), temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one another. Purging was considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on September 9, 2013 indicated the following exceedances of the applicable PADEP Used-Aquifer TDS \leq 2,500 milligrams per liter (mg/L) Residential Statewide Health Standard (UARSHS) MSCs:

- Methyl tert-butyl ether (MTBE) in wells MW-3 and MW-21.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the third quarter of 2013 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

A MTBE isoconcentration contour map for the September 9, 2013 (third quarter of 2013) groundwater sampling event is presented as **Figure 4**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

PLANNED ACTIVITY

The following activities are currently planned for the 4th Quarter of 2013:

- Remedial system operation and maintenance (including permit-required sampling);
- Quarterly groundwater gauging and sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).
Depth-to-groundwater results are reported in feet below top-of-casing (ft-btoc).
All results reported in ug/l.
Bold values indicate levels above LRI.
Bold and shaded values indicate exceedance of PADEP UARSHS MSCs.
NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Notes

VC Check standard was outside the QC range. Data accepted based on acceptable LCS.

Definitions

Surrogate values must be within the indicated range, otherwise the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the MDL are considered estimated values.

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

Fairway Laboratories, Inc.

PADEP Facility ID #17-14821/PAUSTIF Claim #2008-0034(M)**

Dear Mr. Ferguson:

Letterle & Associates, LLC (Letterle) is pleased to submit this Remedial Action Progress Report (RAPR) for the above referenced facility. This RAPR presents the groundwater monitoring data from the fourth quarter of 2013 and also includes a description of remedial activities completed from October 1, 2013 through December 31, 2013 (fourth quarter of 2013).

If you have any questions or comments regarding this report, please feel free to contact me at (814) 355-2241 or jhill@letterleassociates.com.

Sincerely,

A handwritten signature in black ink, appearing to read "Jed Hill".

Number of Wells:	14 monitoring wells (on-site wells MW-2A, MW-32, and MW-33 and off-site monitoring wells MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, and MW-30). 8 remediation system extraction wells (MW-1, MW-1A, MW-2, MW-28, MW-31, MW-34, MW-35, and MW-36).
Wells Containing LNAPL:	0

Letterle & Associates, LLC (Letterle) has been contracted by United Refining Company (United) of Pennsylvania (PA) to perform remedial activities at the Kwik Fill M-90 facility located at 1322 South 2nd Street in Lawrence Township, Clearfield County, Clearfield, PA (the site).

The site location is depicted on the 7.5-minute United States Geological Survey (USGS) Topographic Quadrangles of Clearfield and Glen Richey, PA presented as **Figure 1**. The site exists at an approximate elevation of 1,045 feet above mean sea level (ft-amsl). A more detailed site layout map, which fully depicts the site area, is presented as **Figure 2**.

This Remedial Action Progress Report (RAPR) includes a description of the on-going remedial action activities and presents the groundwater monitoring data obtained at the site during the fourth quarter of 2013.

SITE HISTORY/PROJECT SUMMARY

The site is currently an active retail fueling (gasoline and diesel) station, which has two, 10,000-gallon and one, 8,000-gallon steel underground storage tanks (USTs). The two 10,000-gallon USTs were installed in 1969 and the 8,000-gallon UST was installed in 1974. One 10,000-gallon UST and one 8,000-gallon contain unleaded gasoline and the remaining 10,000-gallon UST (in the middle) contains diesel fuel.

On June 15, 1995, the 10,000-gallon unleaded gasoline UST (#002) failed a tightness test. The PA Department of Environmental Protection (PADEP) was notified of the failure and subsequently, Mountain Research, Inc. (MRI) was retained by United in May 1996 to perform site characterization activities.

From June 1996 through October 1997, four soil boring/monitoring wells, MW-1, MW-1A, MW-2, and MW-2A, were installed on the site and five monitoring wells, MW-3 through MW-7, were installed off-site, on the Beckwith Machinery Company (BMC) property. Quarterly groundwater sampling began in February 1996. Groundwater analytical results for the monitoring wells indicated unleaded gasoline constituents at concentrations above their respective Medium Specific

Concentration (MSC) values. In June 1997, soil/groundwater samples were collected on-site and in the right-of-way of South 2nd Street. The results of the investigation indicated several soil/groundwater samples contained unleaded gasoline constituents at concentrations above their respective MSC values.

MRI prepared a Remedial Action Plan (RAP) in July 1999 proposing a Matrix Trailer Mounted Oxygen Injection System. The PADEP approved the RAP in January 2000. In February 2000, system installation was initiated. The system consisted of eight oxygen injection points and a small trailer to house any ancillary equipment. On April 12, 2000, the system was activated. The system was operational from April 12, 2000 until the first quarter of 2005. From February 1996 through first quarter of 2005, MRI performed quarterly groundwater sampling from the monitoring well network.

From early 2005 through mid-2006, additional site investigations were initiated at the site to re-evaluate the remedial approach. In October 2006, a Supplemental Site Characterization Report (SCR) and RAP Addendum was submitted to the PADEP. The Supplemental SCR/RAP Addendum identified two separate source areas, one on-site and one off-site at the BMC property. The on-site source area (Source Area #1) was found to have impacted groundwater beneath the site and downgradient on the former BMC property. Impacted groundwater from Source Area #2 was found to be related to an off-site release and not associated with the Kwik Fill M-90 facility. The Supplemental SCR/RAP Addendum strategy included remediating groundwater via an air sparge/soil vapor extraction (AS/SVE) system. An additional RAP Addendum was submitted in December 2006. The PADEP approved the Supplemental SCR/RAP Addendum and additional RAP Addendum in January 2007, with modifications. An AS/SVE system was installed at the site and operated from November 2007 through the fourth quarter of 2008.

A second release of unleaded gasoline occurred at the site, and was reported in February 2008. Additional site characterization activities were initiated and an Additional SCR and RAP Addendum was submitted in June 2011. The June 2011 Additional SCR/RAP Addendum included the selection of a dual phase extraction (DPE)/SVE system to address on-site soil and groundwater and enhanced in-situ bioremediation (EB) to address off-site groundwater. The June RAP Addendum was approved by the PADEP in July 2011.

REMEDIAL ACTION PLAN IMPLEMENTATION

The PA Underground Storage Tank Indemnification Fund (PAUSTIF) and their administrator, ICF International (ICFI), put the site remedial work out for competitive bid. The proposed scope of work was based upon the July 2011 approved RAP. Letterle was awarded the bid in March of 2012 and began implementation of the approved RAP.

Remedial actions completed in previous quarters include off-site well abandonment, DPE well installation, remedial system trenching and piping, remedial system installation, and the application of a chemical oxidant as part of an enhanced bioremediation feasibility study.

Remediation System

The remedial system trailer was constructed and mobbed to the site during the third quarter of 2012 and began operation on October 30, 2012. The principal DPE system components housed within the trailer include:

- Two claw pumps;
- One air compressor;
- One air/water separator (AWS) tank;
- One equalization tank;
- Two transfer pumps and level controls;
- Six pneumatic groundwater pumps;
- Four 400-pound liquid-phase granular activated carbon (GAC) vessels (high pressure units);
- Two 600-pound vapor-phase GAC vessels; and,
- Control panel for the claw pumps, air compressor, and the transfer pumps (including all system interlocks).

The recovered groundwater is treated and discharged to the sanitary sewer under an issued permit from the Clearfield Municipal Authority (CMA). Under the terms of the permit, analytical reports and totalizer readings are reported in Discharge Monitoring Reports (DMR) on a monthly basis to the CMA. Petroleum impacted soil and groundwater remediation systems have been listed as exempt from the Plan Approval/Operating permit requirements by PADEP, Division of Air Quality. The remediation system is operated under the exemption requirements.

QUARTERLY SITE ACTIVITIES COMPLETED – 4TH QUARTER 2013

Remediation System Operating Summary

Start Date:	October 30, 2012
4 th Quarter 2013 System Uptime:	86%
4 th Quarter 2013 Total Gallons Treated:	195,199 gallons
Total Gallons Treated To Date:	879,435 gallons

System Sampling Dates

Groundwater Influent, Midfluent, Effluent:	October 7, 2013
	November 4, 2013
	December 13, 2013

	October 23, 2013
	November 4, 2013
	November 27, 2013
	December 13, 2013
	December 30, 2013
Vapor:	October 7, 2013

Groundwater Gauging/Sampling

The monitoring well network is gauged and sampled on a quarterly basis to analyze the effectiveness of the remediation system and to monitor groundwater impacts/movement at the site. Approximately one week prior to groundwater gauging/sampling, the remediation system was deactivated to allow for static groundwater conditions.

Groundwater Gauging

Letterle completed a quarterly groundwater gauging event on December 2, 2013. A total of 15 wells were gauged:

- *15 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-5, MW-7, MW-10, MW-14, MW-15, MW-21, MW-22, MW-23, MW-29, MW-30, MW-32, and MW-33.

Gauging Methodology

Depth-to-groundwater was measured in each well to determine groundwater elevations and interpret the predominant direction of groundwater movement. Depth-to-groundwater measurements were recorded using an electronic water level indicator capable of measuring to within 0.01 feet of accuracy. The electronic water level indicator was decontaminated between wells.

Gauging Results

Groundwater elevation data collected during the fourth quarter of 2013 groundwater gauging event indicates the following:

- Groundwater elevations in shallow overburden groundwater ranged from 1,134.93 feet in MW-7 to 1,145.39 feet in MW-2A;
- The predominant direction of movement in shallow overburden groundwater is interpreted to be to the northwest (towards the West Branch Susquehanna River); and,
- Using the December 2, 2013 groundwater elevation data, a groundwater hydraulic gradient of 0.027 feet per foot (ft/ft) between groundwater monitoring wells MW-2A and MW-7 was calculated.

Table 1 summarizes the historical groundwater gauging data and also presents the resultant groundwater gauging results from the fourth quarter of 2013 groundwater gauging event. A groundwater potentiometric surface contour map for the December 2, 2013 groundwater gauging event is presented as **Figure 3**.

Groundwater Sampling

Letterle completed a quarterly groundwater sampling event on December 2, 2013. A total of 14 wells were sampled:

- *14 wells in the shallow overburden groundwater monitoring well network:* MW-2A, MW-3, MW-4, MW-7, MW-9, MW-10, MW-14, MW-15, MW-17, MW-21, MW-29, MW-30, MW-32, and MW-33.

Sampling Methodology

Subsequent to gauging the groundwater level in each well, low-flow sampling was initiated. For wells shallower than 20 feet, a combination of polyethylene and silicon tubing are utilized in conjunction with a peristaltic pump. The peristaltic pump is then utilized to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. For wells deeper than 20 feet, polyethylene tubing is utilized in conjunction with a two-inch Mini-Monsoon submersible pump to purge the well at a low flow rate of <0.5 liters (500 milliliters) per minute. The intake of each respective pump was placed approximately three feet below the measured water level. In general, each well is purged at a rate of 100-400 milliliters per minute to avoid creating drawdown. If a well was dewatered, a bailer was utilized to collect the sample after the well recovered.

The purged groundwater is then passed through a flow-through cell that measures dissolved oxygen (DO), pH, total dissolved solids (TDS), temperature, specific conductivity, and oxidation-reduction potential (ORP). Measurements of these parameters were recorded every 5 minutes. These measurements were recorded until three consecutive readings stabilized to within 10% of one another. Purging was considered to be complete upon parameter stabilization for three consecutive readings. Once stabilization was documented, the flow-through cell was disconnected and the sample was immediately collected from the discharge line.

The pump was decontaminated between each sampled well. The purged groundwater was filtered through a mobile GAC vessel and then discharged to the ground surface.

The samples were sealed in pre-preserved laboratory supplied glassware, labeled, custody sealed, placed in an ice-filled cooler, and returned to Letterle's office. The samples were stored in a refrigerator (at 4 °C) until they were collected by the laboratory. The samples were submitted to Fairway Laboratories of Altoona, PA, for analysis of the pre-March 15, 2008 PADEP Land Recycling Program Technical Guidance Manual, Table IV-9 - Short List of Petroleum Products, specifically unleaded gasoline constituents (PADEP unleaded gasoline short list constituents) via United States Environmental Protection Agency (USEPA) Method 8260B and were accompanied by Chain-of-Custody documentation.

Sampling Results

The groundwater analytical results from the groundwater sampling event conducted on December 2, 2013 indicated no exceedances of the applicable PADEP Used-Aquifer TDS \leq 2,500 milligrams per liter (mg/L) Residential Statewide Health Standard (UARSHS) MSCs.

Table 1 summarizes the historical groundwater analytical data and also presents the resultant groundwater analytical results from the fourth quarter of 2013 groundwater sampling event. Groundwater analytical laboratory reports are included in **Appendix A**.

Groundwater samples were not collected from MW-9 and MW-17 due to the inability to locate the respective monitoring wells.

PLANNED ACTIVITY

The following activities are currently planned for the 1st Quarter of 2014:

- Remedial system operation and maintenance (including permit-required sampling);
- Quarterly groundwater gauging and sampling; and,
- Quarterly reporting.

Notes: Groundwater elevation data reported in feet (ft).
 Depth-to-groundwater results are reported in feet below top-of-casing (ft-btoc).
 All results reported in ug/l.
 Bold values indicate levels above LRL.
 Bold and shaded values Indicate exceedance of PADEP UARSHS MSCs.
 NG - Not Gauged. NA - Not Analyzed. NS - Not Sampled.

Definitions

If surrogate values are not within the indicated range, then the results are considered to be estimated.

Reporting limits are adjusted accordingly when samples are analyzed at a dilution due to the matrix.

The following analyses are to be performed immediately upon sampling: pH, sulfite, chlorine residual, dissolved oxygen, filtration for ortho phosphorus, and ferrous iron. The date and time reported reflect the time the samples were analyzed at the laboratory.

MBAS, calculated as LAS, mol wt 320

If the solid sample weight for VOC analysis does not fall within the 3.5-6.5 gram range, the results are considered estimated values.

Samples collected by Fairway Laboratories' personnel are done so in accordance with Standard Operating Procedures established by Fairway Laboratories.

* P indicates analysis performed by Fairway Laboratories, Inc. at the Pennsdale location. This location is PaDEP Chapter 252 certified.

< Represents "less than" - indicates that the result was less than the reporting limit.

MDL Method Detection Limit - is the lowest or minimum level that provides 99% confidence level that the analyte is detected. Any reported result values that are less than the RL are considered estimated values.

RL Reporting Limit - is the lowest or minimum level at which the analyte can be quantified.

[CALC] Indicates a calculated result. Calculations use results from other analyses performed under accredited methods.

Fairway Laboratories, Inc.

Fairway Labs in Altoona, PA is a NELAP (National Environmental Laboratory Accreditation Program) accredited lab, and as such, certifies that all applicable test results meet the requirements of NELAP, unless otherwise stated on the analytical report.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.
